

## General Purpose Cortex-M0+ Microcontroller Flash 64KB, SRAM 6KB, ADC, LCD Driver

User's Manual Version 1.40

### Introduction

This user's manual contains complete information for application developers who use A31G123 or A31G122 for their specific needs.

The A31G12x series is a 32-bit general purpose microcontroller for various appliances. To meet the requirements for the complexity and high performance in consumer electronics, the A31G12x series incorporates ARM's high-speed 32-bit Cortex-M0+ Core, and has a flash memory of up to 64 KB and an SRAM of 6 KB.

As shown in the following figure, the A31G12x series has various peripherals such as 16-bit timers, 32-bit timers, a 16-bit timer with 6-channel PWM, 12-bit ADC, CRC generator, UART, USART, I2C, LCD driver/controller, etc. The A31G12x series also has a POR, LVR, LVI, and an internal RC oscillator. The A31G12x series support sleep and deep sleep modes to reduce power consumption.

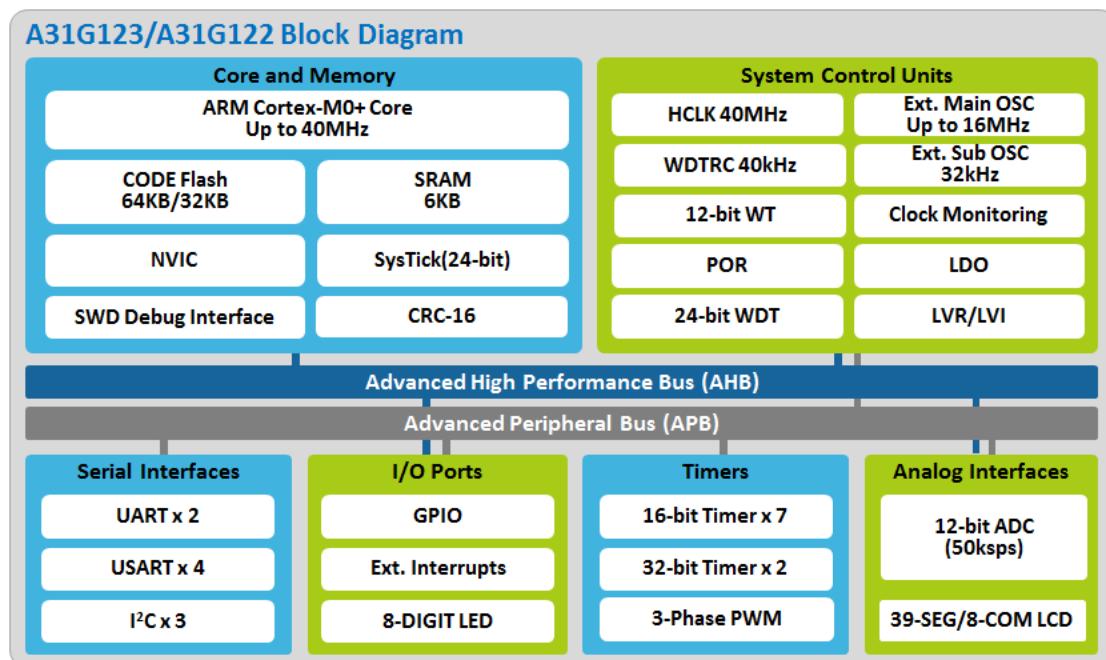

Figure 1. A31G12x series Block Diagram

### Reference document

- [A31G12x datasheet](#) includes production data and features.
- [A31G12x application note](#) includes an overview of hardware implementation of A31G12x.

## Contents

Reference document .....	1
<b>1 Description .....</b>	<b>14</b>
1.1 Device overview .....	15
1.2 Block diagram .....	16
1.3 Functional description .....	17
1.3.1 ARM Cortex-M0+.....	17
1.3.2 Nested vector-interrupt controller (NVIC).....	17
1.3.3 64KB/32KB internal code flash memory .....	17
1.3.4 6KB internal SRAM .....	17
1.3.5 Boot logic.....	17
1.3.6 System Control Unit (SCU) .....	17
1.3.7 24-bit Watchdog timer (WDT).....	17
1.3.8 Multi-purpose 16-bit timer and 32-bit timer .....	17
1.3.9 16-bit Timer with 6 Channel PWMs.....	18
1.3.10 USART (UART and SPI) .....	18
1.3.11 Inter-Integrated Circuit interface (I2C).....	18
1.3.12 Universal Asynchronous Receiver/Transmitter (UART).....	18
1.3.13 General PORT I/Os (GPIO).....	18
1.3.14 12-bit Analog-to-Digital Converter (ADC).....	18
1.3.15 LCD driver/controller .....	18
1.3.16 16-bit Cyclic Redundancy Check (CRC) generator.....	18
<b>2 Pinouts and pin descriptions .....</b>	<b>19</b>
2.1 Pinouts .....	19
2.2 Pin description.....	23
<b>3 CPU.....</b>	<b>30</b>
3.1 Cortex®-M0+ core .....	30
3.2 Interrupt controller .....	31
3.3 Registers .....	34
3.3.1 INTC_PnTRIG: port n interrupt trigger selection register .....	34
3.3.2 INTC_PnCR: port n interrupt control register .....	35
3.3.3 INTC_PnFLAG: port n interrupt flag register .....	35
3.3.4 INTC_EINTnCONF1: external interrupt n configuration register 1 (n= 0 to 3) .....	36
3.3.5 INTC_EINTnCONF2: external interrupt n configuration register 2 (n= 0 to 3) .....	36
3.3.6 INTC_MSK: interrupt source mask register .....	38
<b>4 Control memory organization .....</b>	<b>40</b>
4.1 Internal SRAM.....	41
4.2 Boot mode.....	42
4.2.1 Boot mode pins .....	42
4.2.2 Boot mode connection.....	42
4.3 Flash memory .....	44
4.3.1 Registers .....	46
4.3.2 Procedure for flash memory operation .....	50
4.4 Configure option area .....	52
4.4.1 Configuration option page .....	52
<b>5 SCU (System Control Unit) .....</b>	<b>58</b>
5.1 SCU block diagram .....	58
5.2 Clock system.....	59
5.2.1 HCLK clock domain.....	60
5.2.2 Miscellaneous clock domain.....	60

5.2.3	PCLK clock domain .....	60
5.2.4	Clock configuration procedure.....	61
5.3	Reset.....	63
5.3.1	Cold reset .....	63
5.3.2	Warm reset.....	64
5.3.3	LVR reset.....	65
5.4	Operation mode .....	67
5.4.1	Run mode.....	67
5.4.2	Sleep mode .....	67
5.4.3	Deep sleep mode .....	67
5.5	Pin description for SCU.....	69
5.6	Registers .....	70
5.6.1	SCU_VENDORID: vendor ID register .....	72
5.6.2	SCU_CHIPID: chip ID register .....	72
5.6.3	SCU_REVNR: revision number register .....	72
5.6.4	SCU_PMREMAP: program memory remap register.....	73
5.6.5	SCU_BTPSCR: boot pin status and control register.....	73
5.6.6	SCU_RSTSSR: reset source status register.....	74
5.6.7	SCU_NMISRCR: NMI source selection register .....	75
5.6.8	SCU_SWRSTR: software reset register .....	75
5.6.9	SCU_SRSTVR: system reset validation register .....	76
5.6.10	SCU_WUTCR: wake-up timer control register.....	76
5.6.11	SCU_WUTDR: wake-up timer data register.....	77
5.6.12	SCU_HIRCTRM: high frequency internal RC trim register .....	78
5.6.13	SCU_WDTRCTRM: watchdog timer RC trim register .....	79
5.6.14	SCU_SCCR: system clock control register .....	80
5.6.15	SCU_CLKSRCR: clock source control register.....	81
5.6.16	SCU_SCDIVR1: system clock divide register 1 .....	82
5.6.17	SCU_SCDIVR2: system clock divide register 2 .....	83
5.6.18	SCU_CLKOCSR: clock output control register.....	84
5.6.19	SCU_CMONCR: clock monitoring control register.....	85
5.6.20	SCU_PPCLKEN1: peripheral clock enable register 1 .....	86
5.6.21	SCU_PPCLKEN2: peripheral clock enable register 2.....	87
5.6.22	SCU_PPCLKSR: peripheral clock selection register .....	88
5.6.23	SCU_PPRST1: peripheral reset register 1 .....	89
5.6.24	SCU_PPRST2: peripheral reset register 2.....	91
5.6.25	SCU_XTFLSR: X-tal filter selection register .....	93
5.6.26	SCU_LVICR: low voltage indicator control register.....	94
5.6.27	SCU_LVRCR: low voltage reset control register.....	95
6	PCU and GPIO.....	96
6.1	PCU and GPIO block diagrams .....	96

## 1 Description

The A31G12x series is a microcontroller based on ARM Cortex-M0+ core with a flash memory of up to 64KB, and an SRAM of 6KB. Operation voltage of the device is 1.8V to 5.5V. It provides a highly flexible and cost effective solution for many embedded control applications.

The A31G12x series has 16-bit timers, 32-bit timers, a 16-bit timer with 6-channel PWM, 12-bit ADC, CRC generator, UART, USART, I2C, LCD driver/controller, etc. The A31G12x series also has a POR, LVR, LVI, and an internal RC oscillator. The A31G12x series support sleep and deep sleep modes to reduce power consumption.

## 1.1 Device overview

**Table 1. A31G12x series features and peripheral counts**

Peripheral	Device	A31G12x
CPU	Cortex-M0+	
Flash ROM (Kbytes)	64	
SRAM (bytes)	6KB	
LED Display Drive Capability	Max. 120mA of sink current capability for output of 8 pins (PD0 to PD7)	
I/O	77 programmable	
Timers	Watchdog timer Ten general purpose timers — Periodic, one-shot, PWM, capture mode	
LCD driver	• 39 segments and 8 commons • Duty selectable, resistor bias • 16-step contrast control	
ADC	14-channel input, 12-bit ADC with 50ksps	
CRC generator	16-bit CRC generator, CRC-16, CRC-CCITT	
External communication ports	• 4 USARTs (UART + SPI) • 3 I <sup>2</sup> C • 2 UART	
System fail-safe function	Clock monitoring	
Debug interface	SWD debug interface	
Packages	• LQFP 80-1212 (0.5mm pitch) • LQFP 80-1414 (0.65mm pitch) • LQFP 64-1010 (0.5mm pitch) • LQFP 64-1212 (0.65mm pitch) • LQFP 64-1414 (0.8mm pitch) • LQFP 48-0707 (0.5mm pitch) • MQFP 44-1010 (0.8mm pitch)	
Operating temperature	• -40°C to +85°C (commercial grade) • -40°C to +105°C (Industrial grade)	

## 1.2 Block diagram

Figure 2 shows a block diagram of A31G12x series.

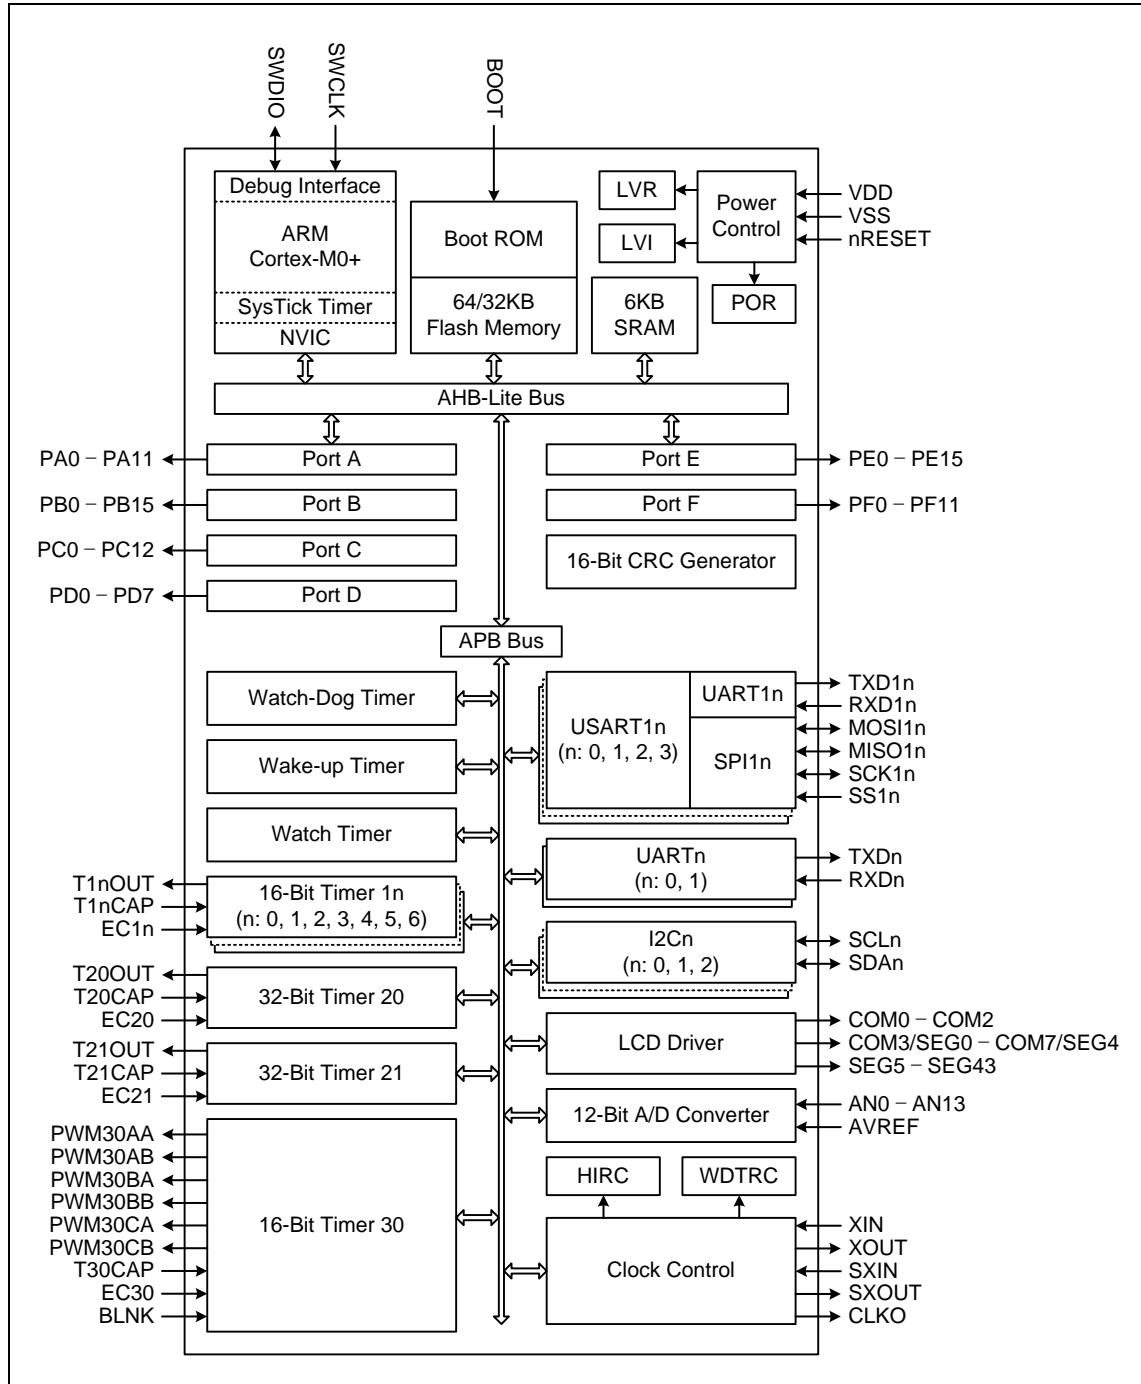

Figure 2. A31G12x series Block Diagram

## 1.3 Functional description

Main features of A31G12x series are summarized below:

### 1.3.1 ARM Cortex-M0+

Cortex-M0+ processor has very low gate count characteristic and high energy efficiency. It is developed for microcontrollers and deeply embedded applications that require an area-optimized and low-power processor.

The core system timer (SYSTICK) provides a simple 24-bit timer, which can be used for a real time operating system (RTOS). It can be used as a simple counter too.

The Cortex-M0+ processor implements the ARMv6-M Thumb instruction set, including a number of 32-bit instructions that use Thumb-2 technology. Hardware single-cycle multiplication is available. Integrated Nested Vectored Interrupt Controller (NVIC) provides deterministic interrupt handling, and SWD debugging features offer the MCU emulation.

### 1.3.2 Nested vector-interrupt controller (NVIC)

External interrupt signals connect to the NVIC, and the NVIC prioritizes the interrupts. Software can set the priority of each interrupt.

The NVIC embedded in the Cortex-M0+ processor core is capable of processing low latency interrupts and efficient processing of late arriving interrupts. All NVIC registers are accessible only using word transfers.

### 1.3.3 64KB/32KB internal code flash memory

A31G12x series has built-in code flash memory of 64KB or 32KB. It supports self-programming feature, and supports ISP and JTAG programming in boot or debug mode.

### 1.3.4 6KB internal SRAM

On-chip 6KB SRAM is used as a working memory space and as a program code area temporarily.

### 1.3.5 Boot logic

A boot logic supports flash programming. The boot logic will be activated when the external boot pin was set to boot mode.

### 1.3.6 System Control Unit (SCU)

An SCU block manages internal power, clock, reset and operation mode. It also controls the analog blocks (Oscillator Block, VDC and LVR).

### 1.3.7 24-bit Watchdog timer (WDT)

A Watchdog timer monitors the system. It generates internal reset or interrupt to notice abnormal status of the system.

### 1.3.8 Multi-purpose 16-bit timer and 32-bit timer

Seven-channel 16-bit and two-channel 32-bit general-purpose timers support the functions introduced below:

- Periodic timer mode
- Counter mode
- PWM mode
- Capture mode

**1.3.9        16-bit Timer with 6 Channel PWMs**

The 16-bit timer has 6 channels of PWMs for 3-phase motor application. 16-bit up/down counter with prescaler supports both triangular and sawtooth waveform.

The PWM has ability to generate internal ADC trigger signal to measure the signal on time.

Dead time insertion and emergency stop functionality make sure that the chip and the system are under a safe condition.

**1.3.10        USART (UART and SPI)**

USART supports UART and SPI mode. The A31G12x series has 4 channel USART modules.

Boot mode uses this USART block to download flash program.

**1.3.11        Inter-Integrated Circuit interface (I2C)**

A31G12x series has three channels of I2C block and supports up to 1MHz I2C communication. Master and slave modes are available.

**1.3.12        Universal Asynchronous Receiver/Transmitter (UART)**

A31G12x series has two channels of UART block. For accurate baud rate control, a fractional baud-rate generation feature is available.

**1.3.13        General PORT I/Os (GPIO)**

12-bit PA port, 16-bit PB port, 13-bit PC port, 8-bit PD port, 16-bit PE port, and 12-bit PF port are available and provide multiple functions.

- General I/O port
- External interrupt input port and on-chip input debounce filter
- Programmable pull-up, pull-down, and open-drain selection

**1.3.14        12-bit Analog-to-Digital Converter (ADC)**

An ADC can convert analog signal at a conversion rate of up to 50ksps. 14-channel analog MUX provides various combinations of data from external analog signals.

**1.3.15        LCD driver/controller**

A LCD driver supports an internal resistor bias, 16-step contrast control, automatic bias control, and various duties.

**1.3.16        16-bit Cyclic Redundancy Check (CRC) generator**

A31G12x series has two polynomials for the CRC generator: CRC-CCITT and CRC-16.

## 2 Pinouts and pin descriptions

In chapter 2, pinouts and pin descriptions of A31G12x series are introduced.

### 2.1 Pinouts

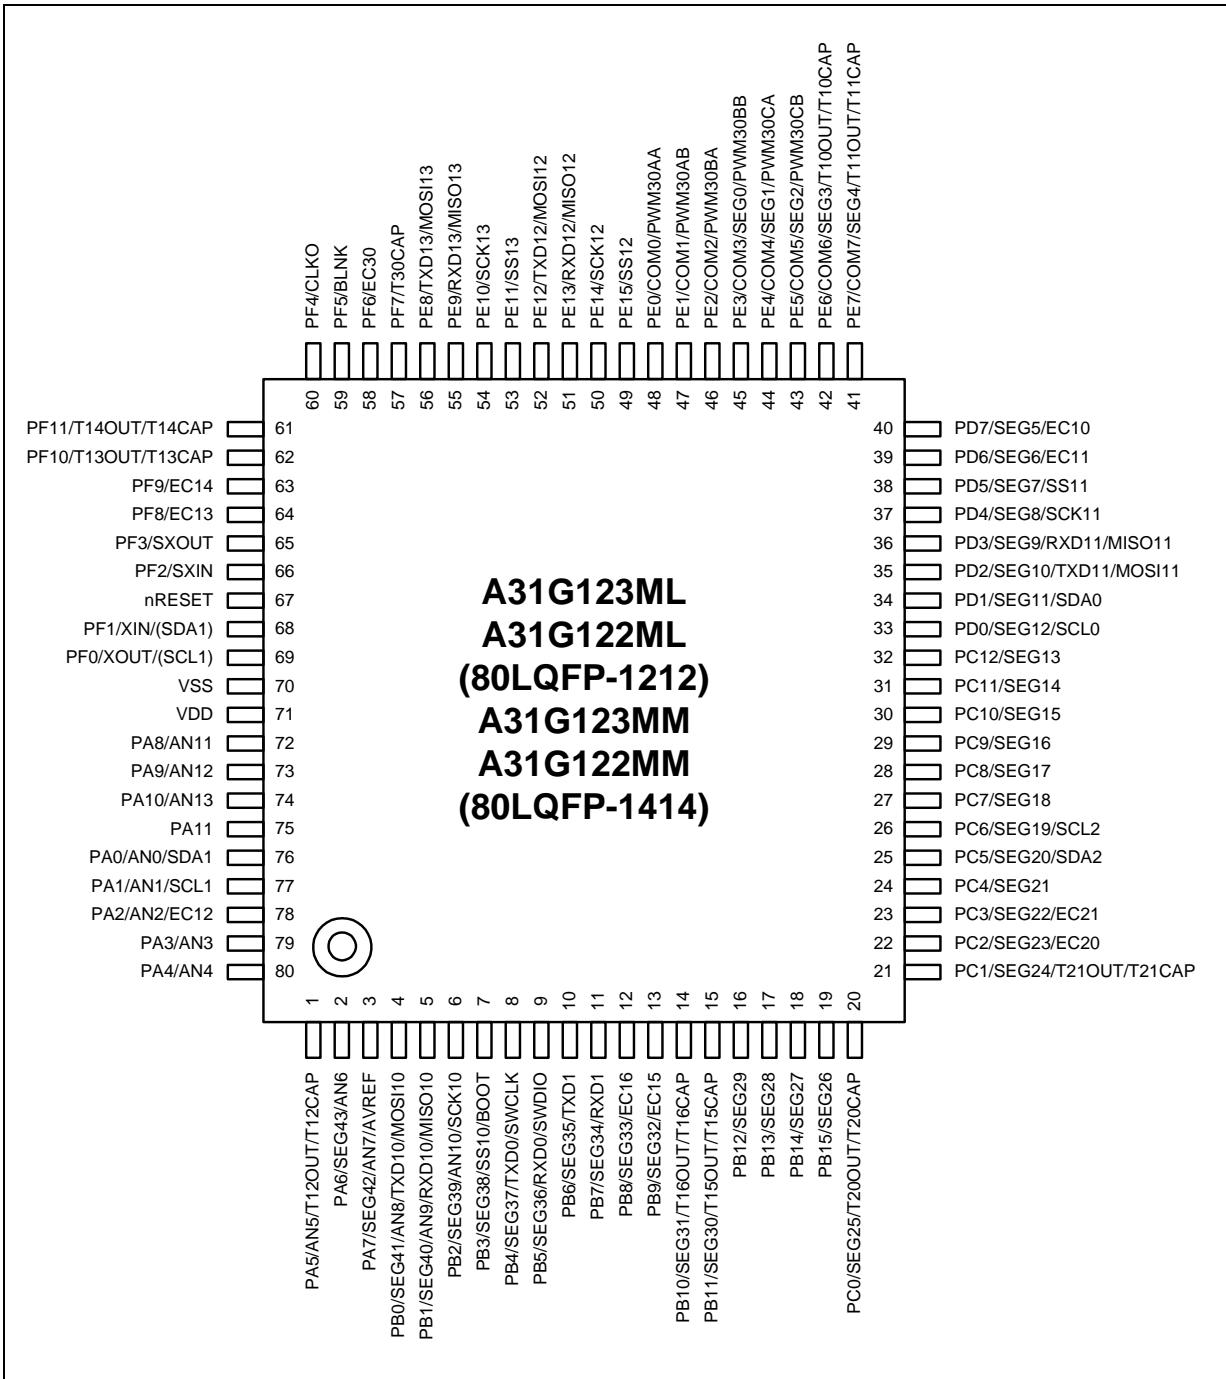

Figure 3. LQFP-80 Pinouts

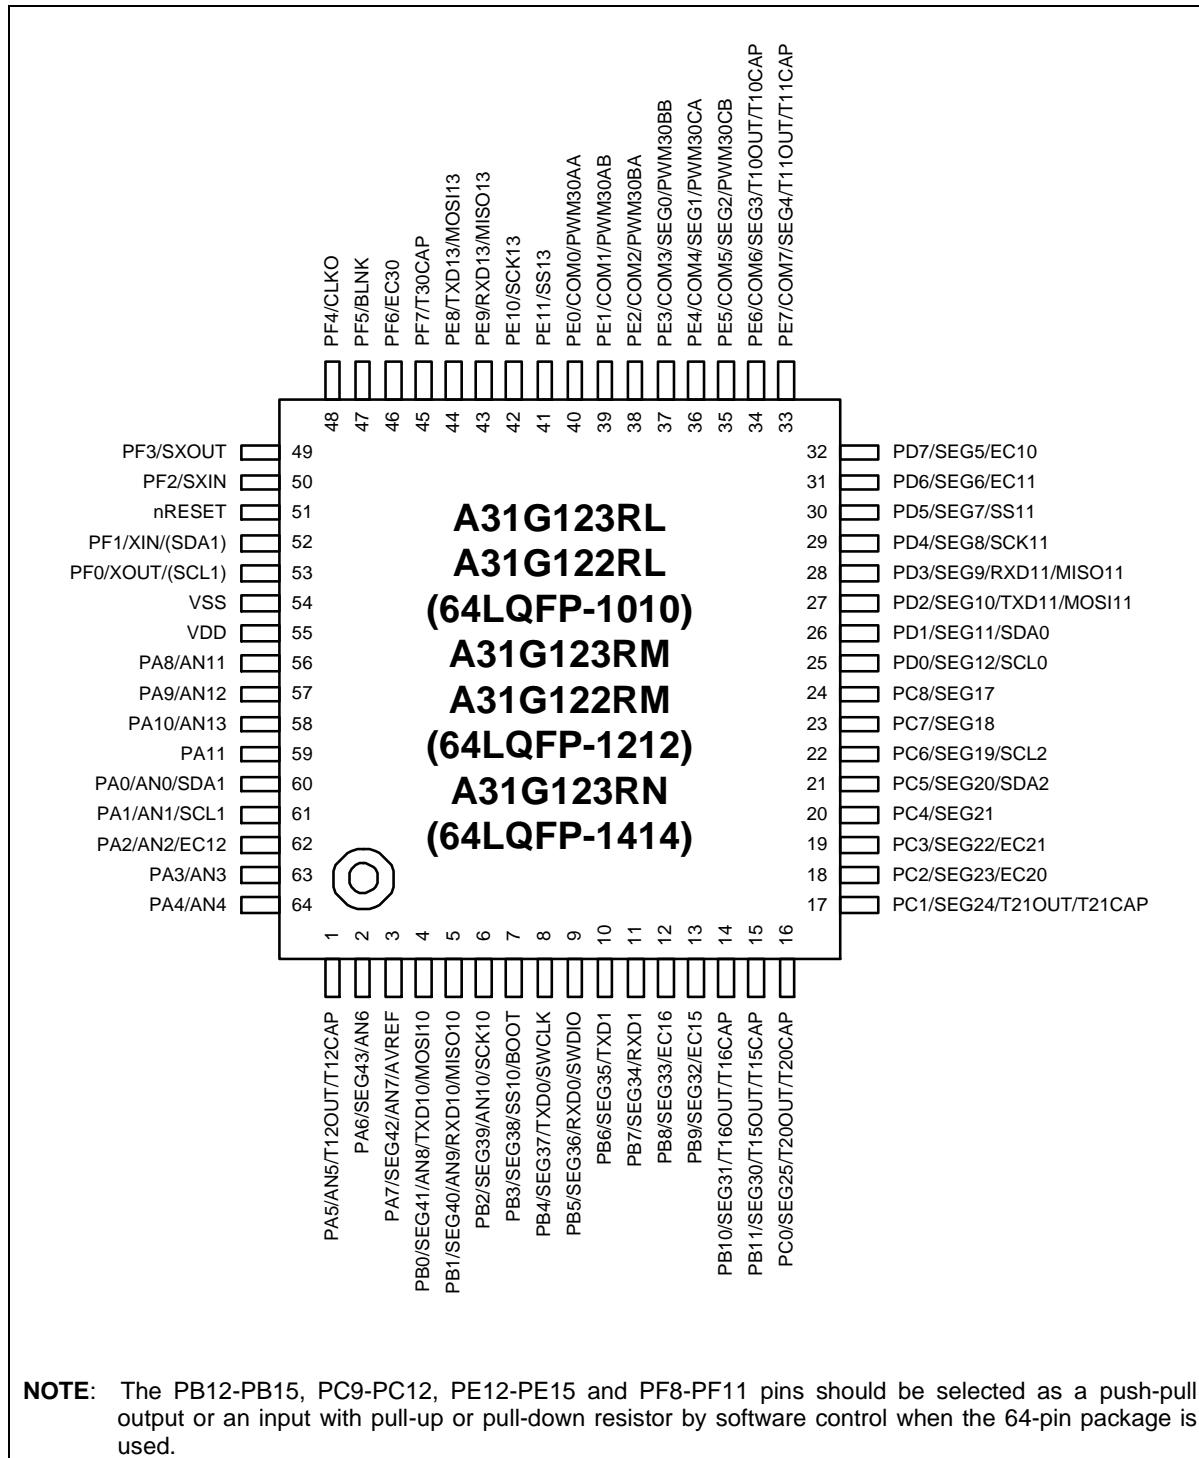

Figure 4. LQFP-64 Pinouts

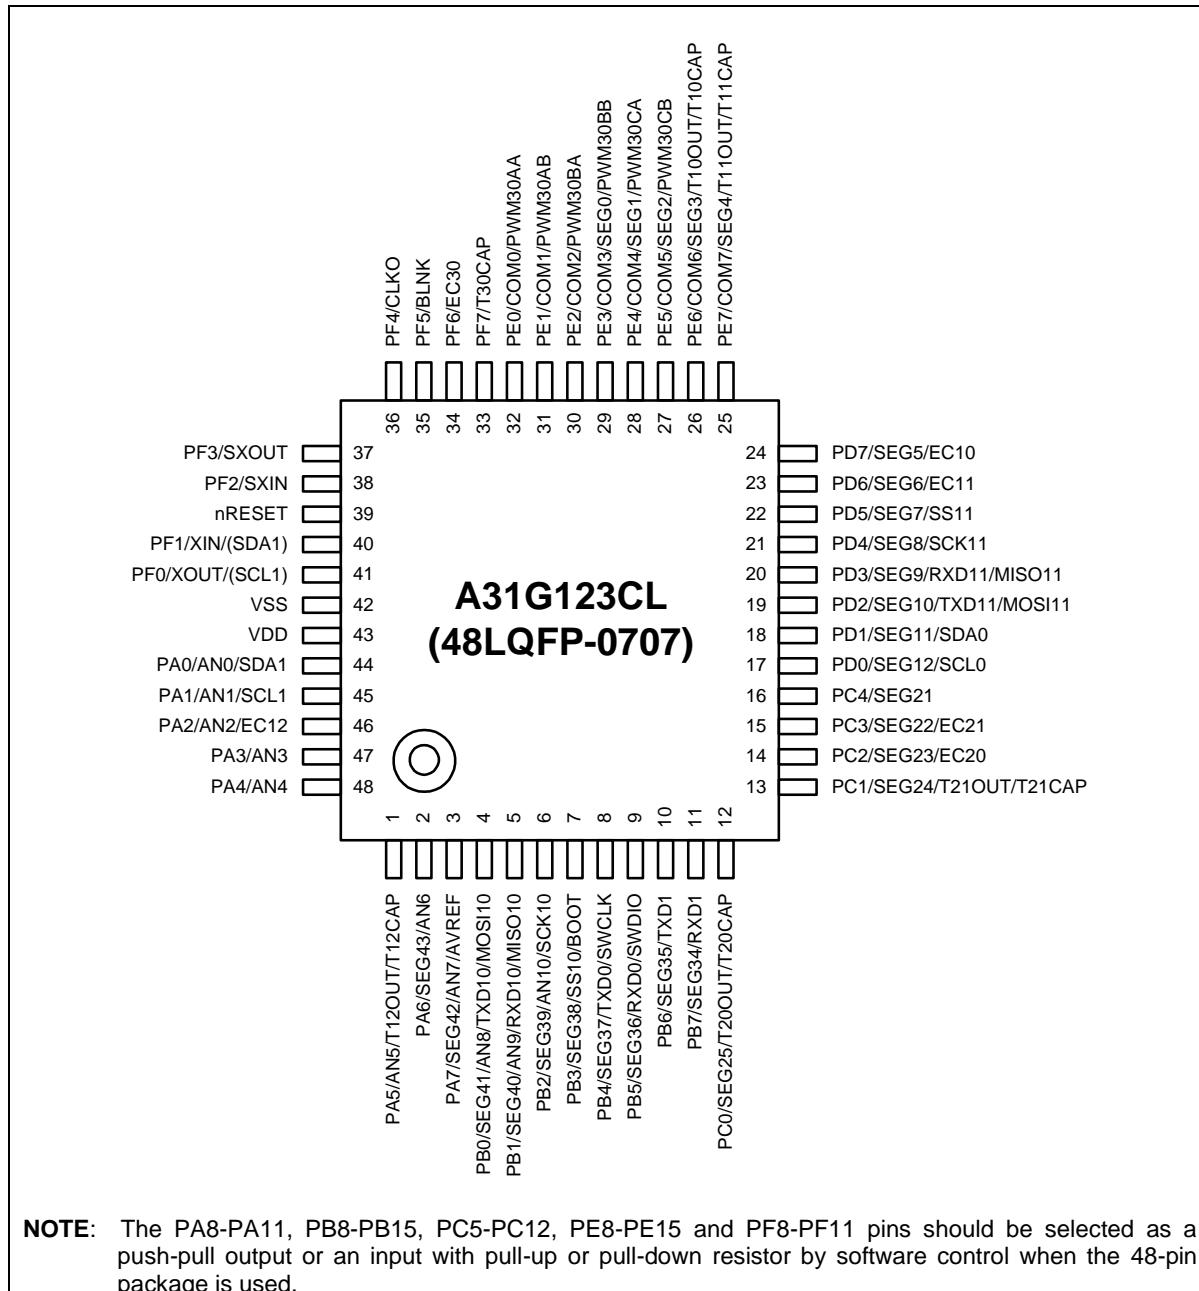

Figure 5. LQFP-48 Pinouts

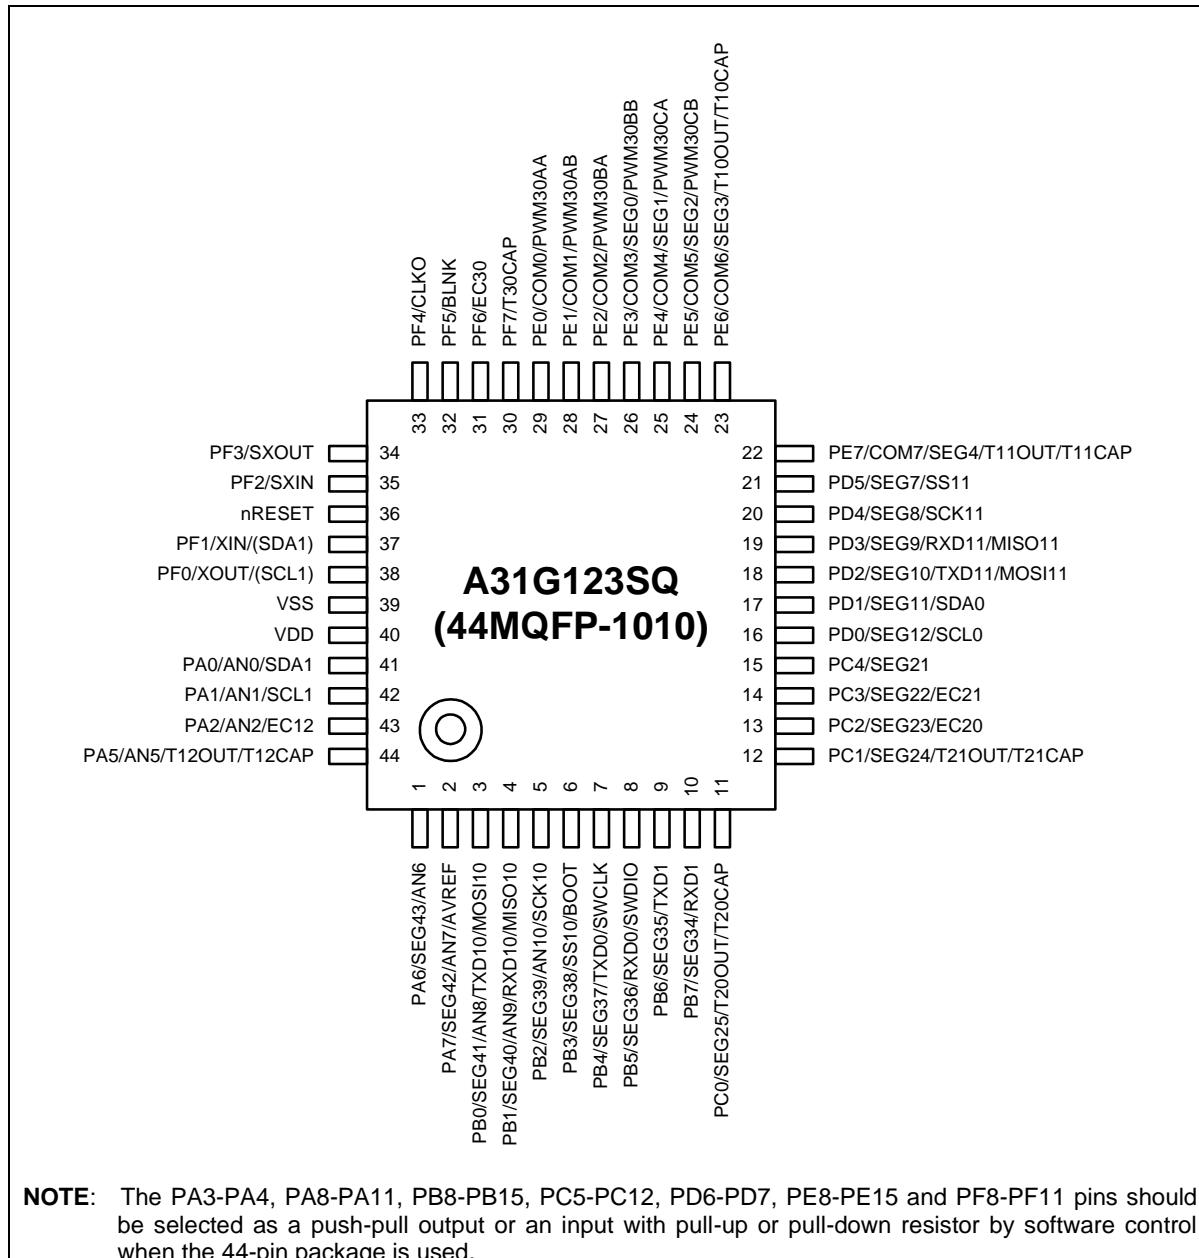

Figure 6. MQFP-44 Pinouts

## 2.2 Pin description

Table 2 shows pin configuration containing one pair of power/ground and other dedicated pins. Multi-function pins have up to five selections of functions including GPIO.

**Table 2. Pin Description**

Pin number				Pin name	Type	Description	Remark

## 3 CPU

A31G12x series uses Cortex® –M0+ as its CPU and includes an interrupt controller named NVIC.

### 3.1 Cortex®–M0+ core

The Cortex-M0+ processor is the most energy-efficient ARM processor available. It builds on the very successful Cortex-M0+ processor, retaining full instruction set and tool compatibility, while further reducing energy consumption and increasing performance.

Please refer to the technical reference manual “ARM DDI 0484C” provided by ARM for detail information of Cortex-M0+.

### 3.2 Interrupt controller

The Cortex-M0+ process has embedded an interrupt controller named NVIC (Nested Vector Interrupt Controller). A31G12x series has additional interrupt control block for controlling 32 interrupt sources generated by internal peripherals.

To use interrupts from internal peripherals, both the NVIC and the interrupt control block must be configured properly. This document describes only the peripheral interrupt controller. For more information about NVIC inside the Cortex-M0+ processor, please refer to the technical reference manual “ARM DDI 0484C” in ARM technical document site.

INTC_EINTxCONF1 INTC_EINTxCONF2	0x0300-0x03FF	RW	External Interrupt Configuration Register1,2	0000_0000
INTC_MSK	0x0400	RW	Interrupt Source Mask Register	0000_0000

**NOTES:**

1. n = B, C, E
2. x = 0 to 3

#### 3.3.1 INTC\_PnTRIG: port n interrupt trigger selection register

INTC\_PnTRIG register is 32-bit size and accessible in 32/16/8-bit (n= B, C, E).

INTC\_PBTRIG =0x4000\_1004, INTC\_PCTRIG =0x4000\_1008

INTC\_PETRIG =0x4000\_1010

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

-															-	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	

x	ITRIGx	Port n Interrupt Trigger Selection bit, x= 0 to 11
0		Edge trigger interrupt
1		Level trigger interrupt

**NOTE:** The A31G12x series only has INTC\_PnTRIG registers for PB0 – PB11, PC0 – PC3, and PE0 – PE3.

### 3.3.2 INTC\_PnCR: port n interrupt control register

INTC\_PnCR register is 32-bit size and accessible in 32/16/8-bit (n= B, C, E).

INTC\_PBCR=0x4000\_1104, INTC\_PCCR=0x4000\_1108

INTC\_PECR=0x4000\_1110

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
								INTCTL11	INTCTL10	INTCTL9	INTCTL8		INTCTL7	INTCTL6	INTCTL5	INTCTL4		INTCTL3		INTCTL2		INTCTL1		INTCTL0								
0x00	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
-	RW	RW	RW	RW				RW	RW	RW	RW		RW	RW	RW	RW		RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

2x+1	INTCTLx	Port n Interrupt Control bits, x= 0 to 11
2x	00	Disable external interrupt (The flag bit won't be set)
	01	Interrupt on falling edge or on low level
	10	Interrupt on rising edge or on high level
	11	Interrupt on both falling and rising edge, No level interrupt

#### NOTES:

- The A31G12x series only has INTC\_PnCR registers for PB0 – PB11, PC0 – PC3, and PE0 – PE3.
- Do not write “11” to the corresponding INTCTLx[1:0] bits when the ITRIGx bit of INTC\_PnTRIG is ‘1’. If so, it may cause a malfunction.

### 3.3.3 INTC\_PnFLAG: port n interrupt flag register

INTC\_PnFLAG register is 32-bit size and accessible in 32/16/8-bit (n= B, C, E).

INTC\_PBFLAG=0x4000\_1204, INTC\_PCFLAG=0x4000\_1208

INTC\_PEFLAG=0x4000\_1210

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

0x0000	0	0	0	0	0	0	0	0x0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
-	RW	-	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW														

x	FLAGx	Port n Interrupt Flag bit, x: 0 to 11
0	No request occurred	
1	Request occurred. The bit is cleared to ‘0’ when ‘1’ is written.	

**NOTE:** The A31G12x series only has INTC\_PnFLAG registers for PB0 – PB11, PC0 – PC3, and PE0 – PE3.

### 3.3.4 INTC\_EINTnCONF1: external interrupt n configuration register 1 (n= 0 to 3)

INTC\_EINTnCONF1 register is 32-bit size and accessible in 32/16/8-bit.

INTC\_EINT0CONF1=0x4000\_1300, INTC\_EINT1CONF1=0x4000\_1304  
INTC\_EINT2CONF1=0x4000\_1308, INTC\_EINT3CONF1=0x4000\_130C

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

RW		RW																													

4x+3	CONFx	Configuration bits for External Interrupt Group n, x: 0 to 7
4x		
	0000	PAx (not used)
	0001	PBx
	0010	PCx
	0011	PDx (not used)
	0100	PEx
	Others	Reserved

**NOTE:** The A31G12x series only has INTC\_EINTnCONF1 registers for PB0 – PB11, PC0 – PC3, and PE0 – PE3.

### 3.3.5 INTC\_EINTnCONF2: external interrupt n configuration register 2 (n= 0 to 3)

INTC\_EINTnCONF2 register is 32-bit size and accessible in 32/16/8-bit.

INTC\_EINT0CONF2=0x4000\_1310, INTC\_EINT1CONF2=0x4000\_1314  
INTC\_EINT2CONF2=0x4000\_1318, INTC\_EINT3CONF2=0x4000\_131C

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

4(x-8)+3	CONFx	Configuration bits for External Interrupt Group n, x: 8 to 11
4(x-8)		
	0000	PAx (not used)
	0001	PBx
	0010	PCx
	0011	PDx (not used)
	0100	PEx
	Others	Reserved

**NOTE:** The A31G12x series only has INTC\_EINTnCONF2 registers for PB0 – PB11, PC0 – PC3, and PE0 – PE3.

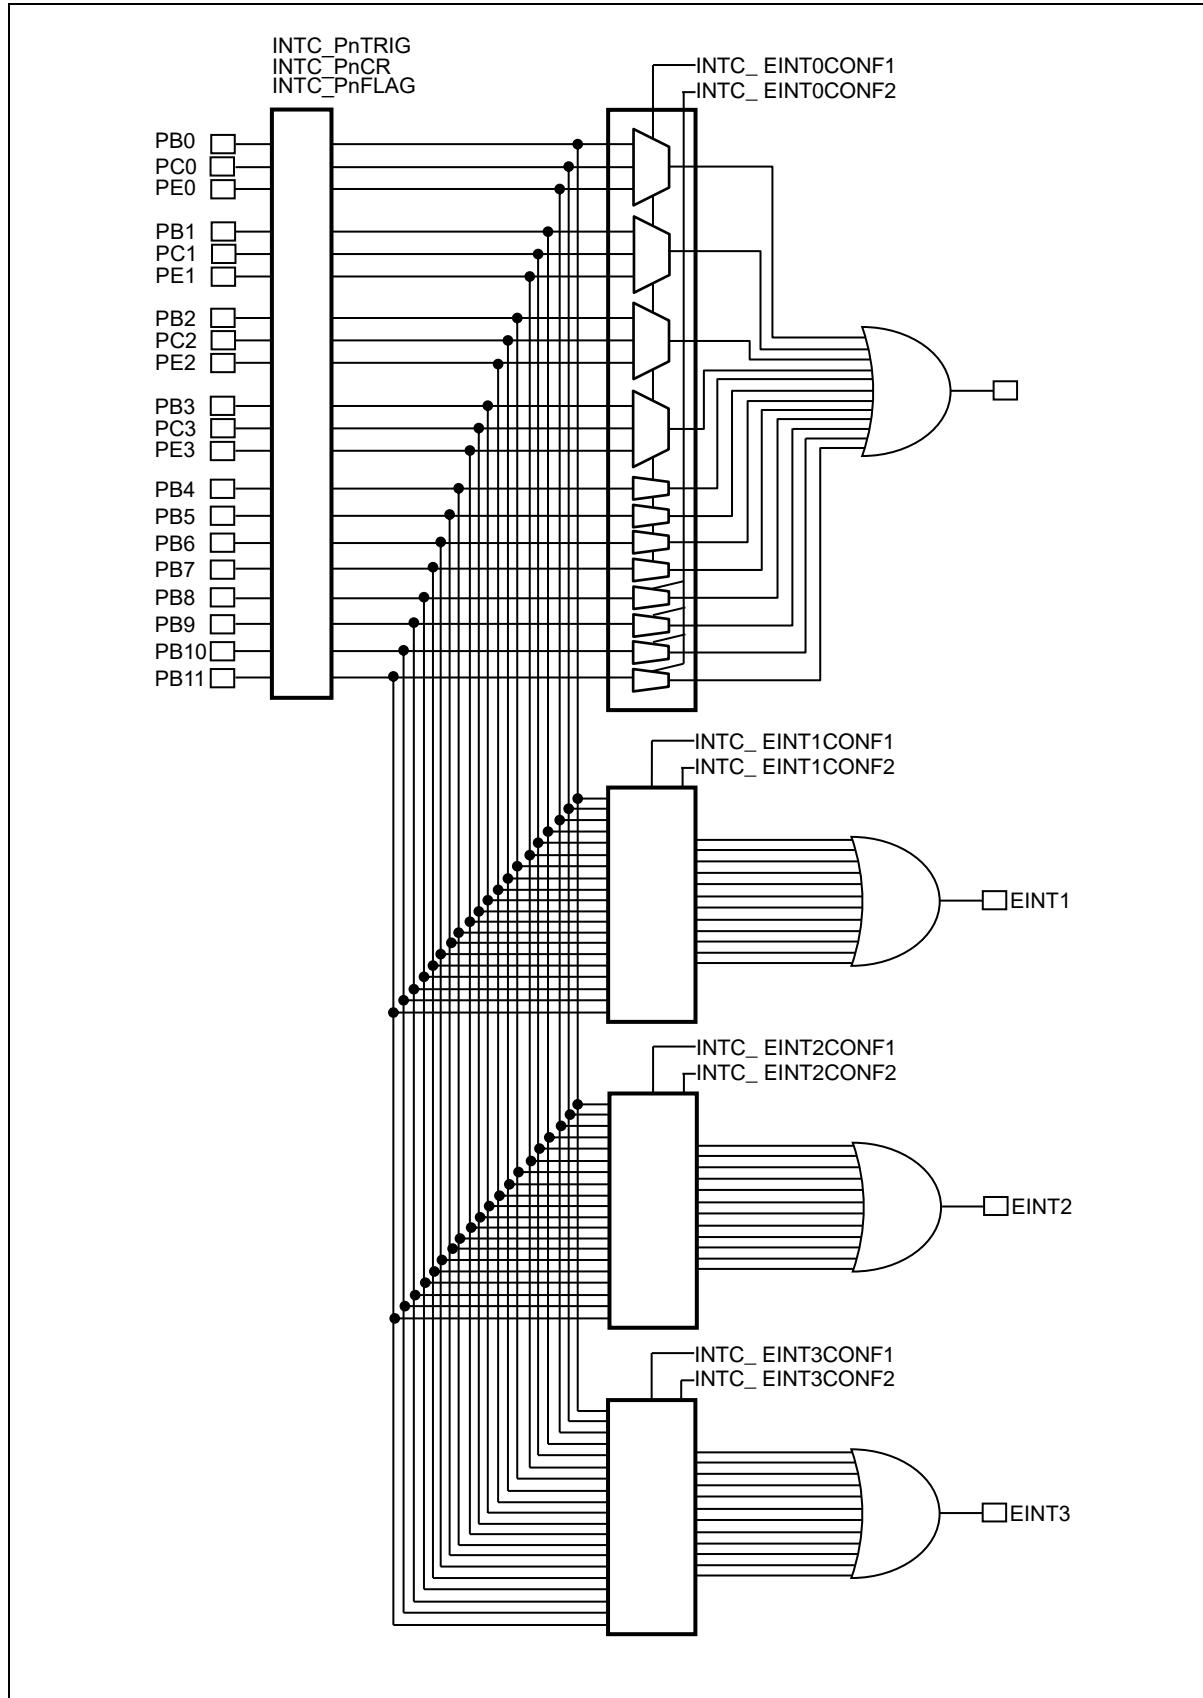

Figure 7. Configuration Map for External Interrupt 0/1/2/3 Group (n = B, C, E)

### 3.3.6 INTC\_MSK: interrupt source mask register

INTC\_MSK register is 32-bit size and accessible in 32/16/8-bit.

																INTC_MSK=0x4000_1400																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## 4 Control memory organization

Figure 8 shows addressable memory space in memory map.

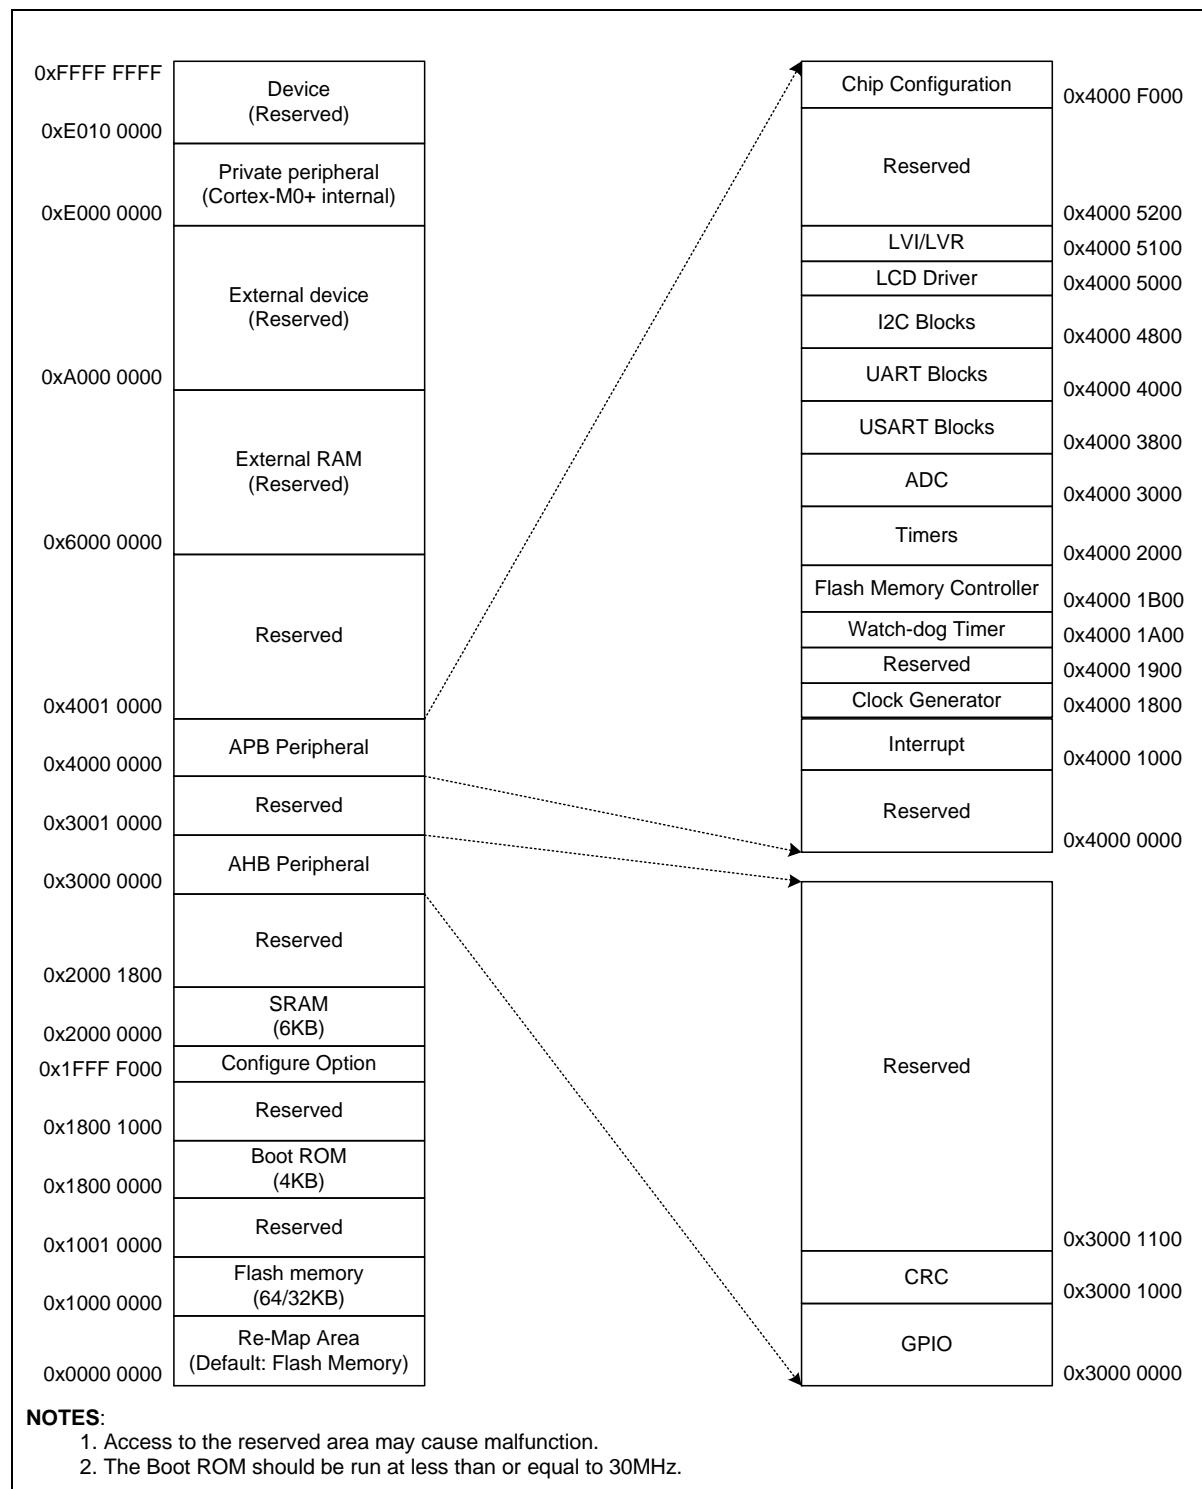

Figure 8. Main Memory Map

## 4.1 Internal SRAM

A31G12x series has a block of 0-wait on-chip SRAM. Its size is 6KB, and its base address is 0x2000\_0000. The SRAM's memory area is mainly for data memory and stack memory. It is possible to locate code area in the SRAM memory for fast operation or for flash erase or program operation for self-program.

This device does not support memory remapping. So jump and return is required to process the code in SRAM memory area.

## 4.2 Boot mode

### 4.2.1 Boot mode pins

A31G12x series has a Boot mode to program the internal flash memory. The Boot mode will be activated by setting a BOOT pin to "Low" level at reset timing (Normal operation mode is "High" level).

The Boot mode supports either UART boot or SPI boot. For the UART boot, TXD10/RXD10 ports are used. For the SPI boot, MOSI10/MISO10/SCK10/SS10 ports are used.

Table 7 introduces pins used in the Boot mode.

**Table 7. Boot Mode Pin List**

Block	Pin Name	Direction	Description
SYSTEM	nRESET	I	Reset Input signal
	BOOT/PB3	I	'0' to enter Boot mode
UART mode of USART10	RXD10/PB1	I	UART Boot Receive Data
	TXD10/PB0	O	UART Boot Transmit Data
SPI mode of USART10	SS10/PB3	I	SPI Boot Slave Selectable after Boot ROM
	SCK10/PB2	I	SPI Boot Clock Input
	MISO10/PB1	I	SPI Boot Data Input with function exchange
	MOSI10/PB0	O	SPI Boot Data Output with function exchange

### 4.2.2 Boot mode connection

A user can design target boards using any of Boot mode ports – UART or SPI mode of USART10. Examples of connection diagrams in the Boot mode are introduced in figures 9 and 10.

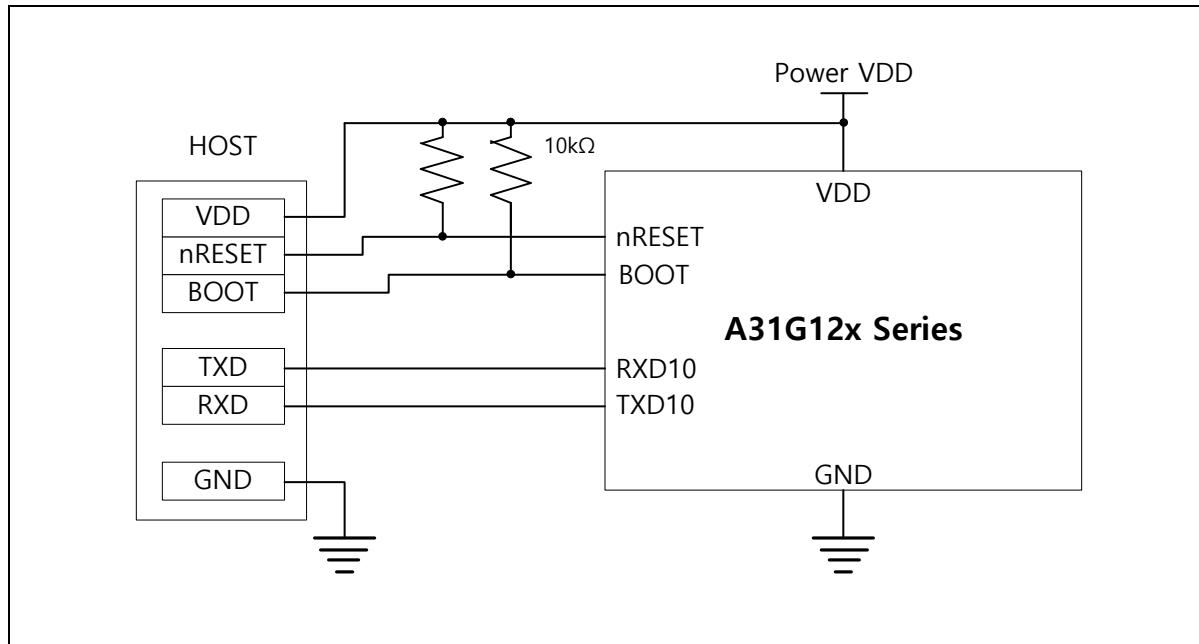

Figure 9. Connection Diagram of UART Boot

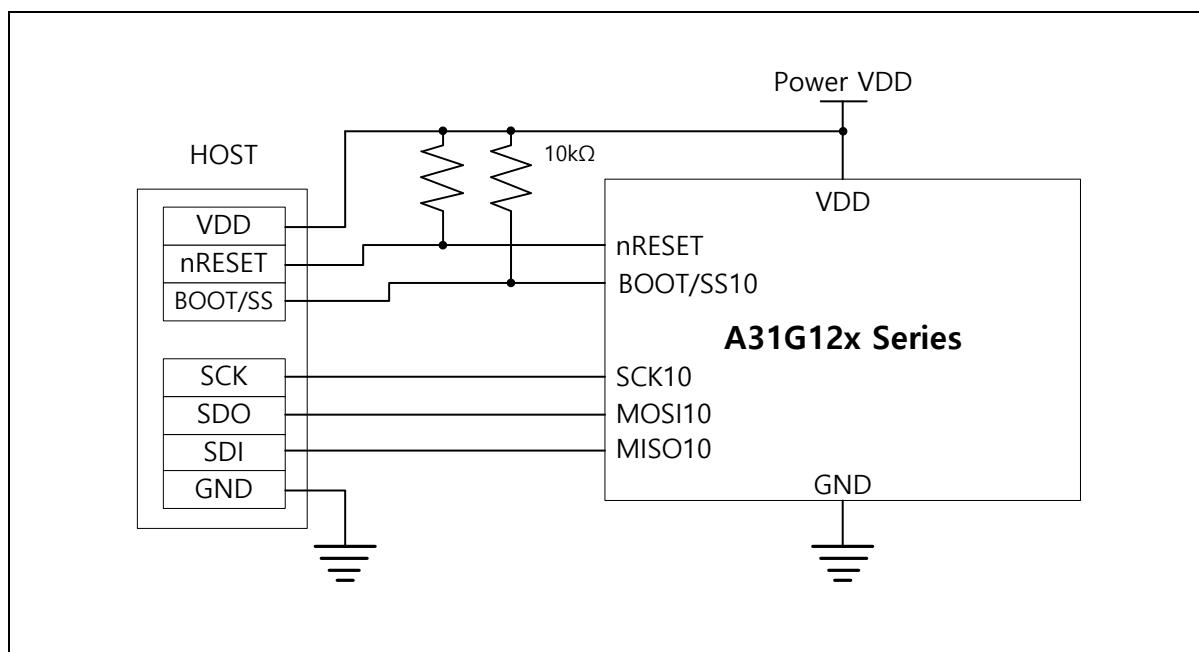

Figure 10. Connection Diagram of SPI Boot

### 4.3 Flash memory

A31G12x series has an internal flash memory featuring the followings:

- 64KB or 32KB Flash code memory
- 32-bit read data bus width
- 128-byte page size
- Page erase and bulk erase available
- 128-byte unit program

**Table 8. Internal Flash Memory Specification**

Item	Description
Size	64KB
Start address	0x1000_0000
End address	0x1000_FFFF
Page size	128-byte
Total page count	512 pages
PGM unit	128-byte
Erase unit	128-byte or bulk

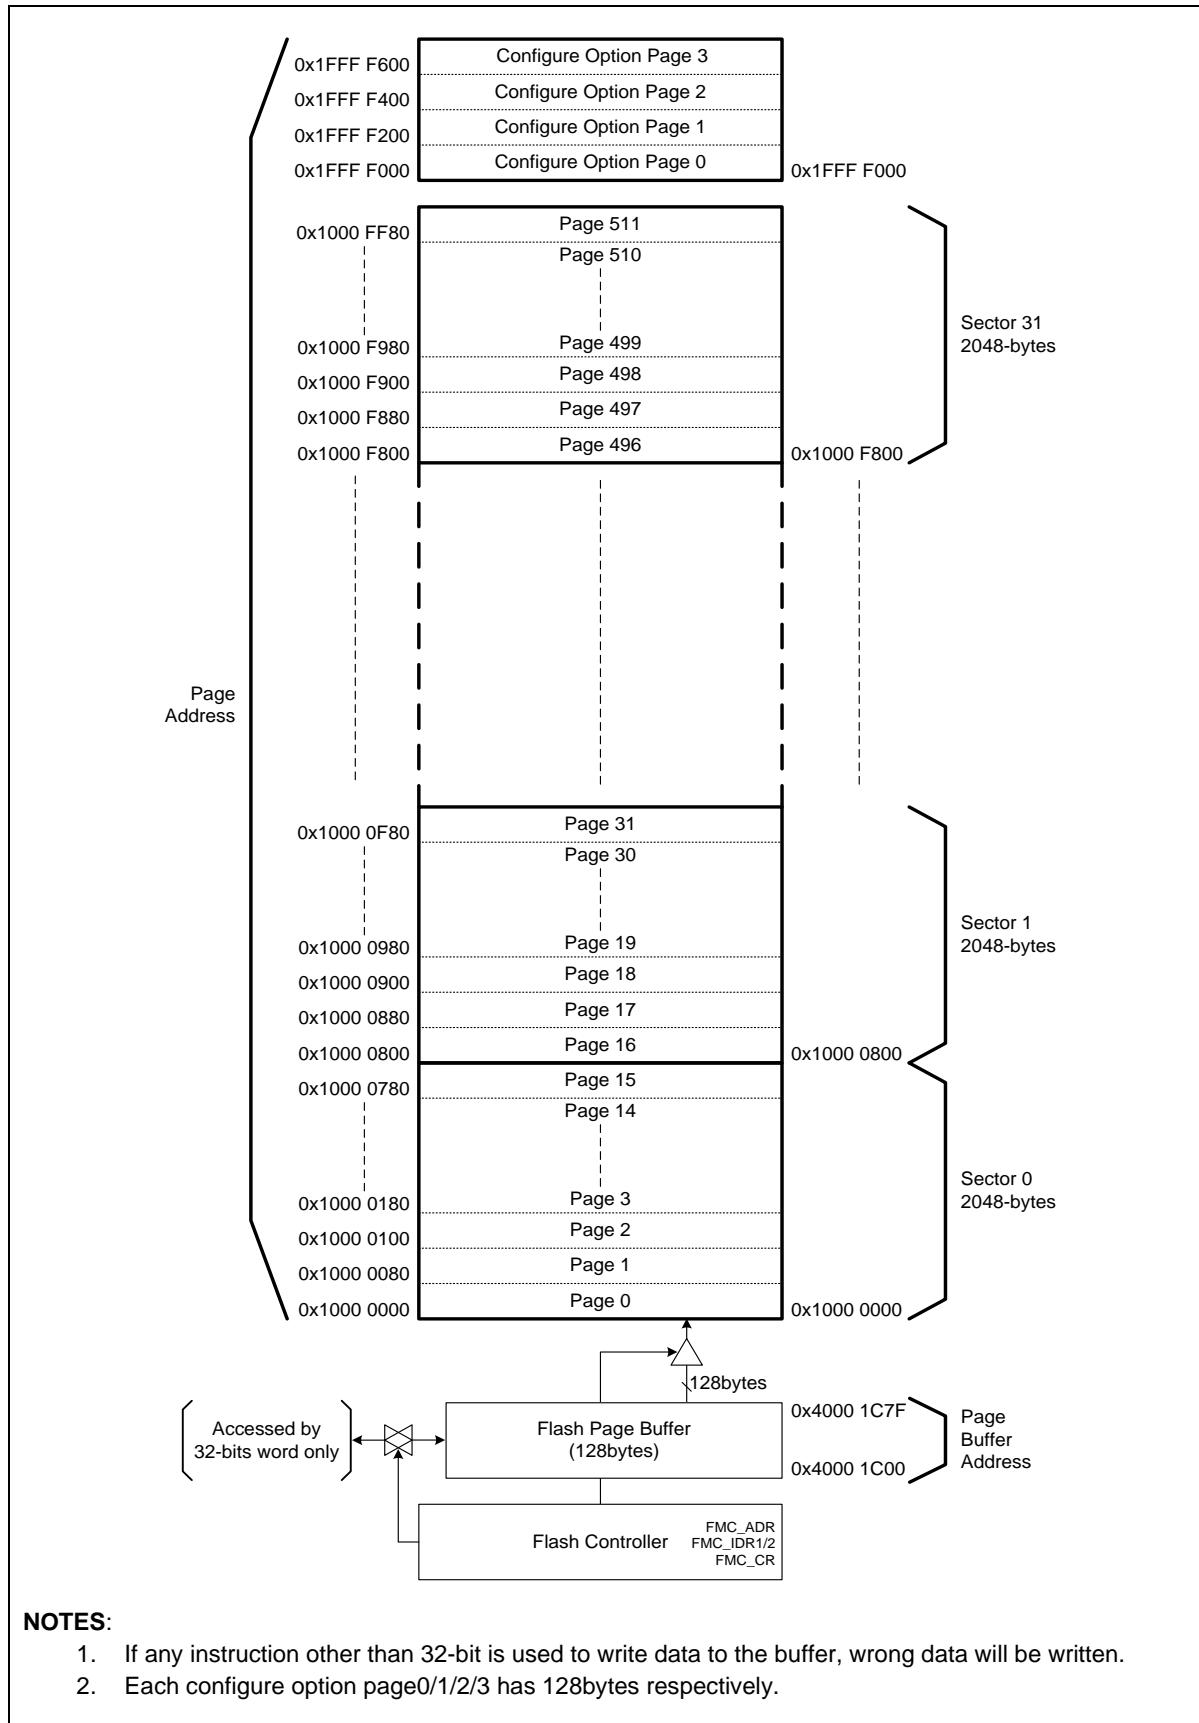

Figure 11. Internal Flash Memory Block Diagram

### 4.3.1 Registers

Base address and register map of the Flash memory controller are shown in Table 9 and Table 10.

**Table 9. Base Address of Flash Memory Controller**

Name	Base address
Flash memory controller	0x4000_1B00

**Table 10. Flash Memory Controller Register Map**

Name	Offset	Type	Description	Reset Value
FMC_ADR	0x0000	RW	Flash Memory Address Register	0x5FFFFF80
FMC_IDR1	0x0004	RW	Flash Memory Identification Register 1	0x00000000
FMC_IDR2	0x0008	RW	Flash Memory Identification Register 2	0x00000000
FMC_CR	0x000C	RW	Flash Memory Control Register	0x00000000
FMC_BCR	0x0010	RW	Flash Memory Configure Area Bulk Erase Control Register	0x00000000

#### 4.3.1.1 FMC\_ADR: flash memory address register

FMC\_ADR register is used to remember the internal flash memory address. This register is 32-bit size.

FMC\_ADR=0x4000\_1B00

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ADDR																															
0x5FFF_FF80																															

31     ADDR     Flash Memory Address Pointer. This register is reset to 0x5FFFFF80  
0                immediately after a single operation.

**NOTE:** The LSB-2bits of the target flash address is always considered to "00b".

#### 4.3.1.2 FMC\_IDR1: flash memory identification register 1

FMC\_IDR1 register is an internal flash memory identification register for flash mode. This register is 32-bit size.

FMC_IDR1=0x4000_1B04																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### NOTES:

1. The FMC\_IDR1/2 registers are automatically cleared to logic 0x00000000 immediately after one time operation except "flash page buffer reset mode".
2. The FMC\_IDR1/2 registers should be written with correct values in turn.
3. If incorrect values are written to the FMC\_IDR1/2 registers, the registers are cleared to logic 0x00000000.

#### 4.3.1.4 FMC\_CR: flash memory control register

FMC\_CR register is an internal flash memory control register. This register is 32-bit size.

FMC_CR=0x4000_1B0C																																											
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0												
WTIDKY								FMKEY								FMBUSY		Reserved		FMOD																							
0x0000								0x00								0	000	0000																									
WO								RW								RO	I	RW																									
31	WTIDKY	Write Identification Key. When writing, write 0x6C93 to these bits, or else writing is ignored.																																									
16																																											
15	FMKEY	Flash Memory Operation Area Selection. 0x00 Selects no area but for flash, induces page buffer reset mode. 0x38 Selects "configure option area" for flash memory erase/write. 0xA4 Selects "flash memory area" for flash memory erase/write. Others Not allowed. FMOPFLAG will be set.																																									
8																																											
7	FMBUSY	Flash Memory Operation Mode Busy. 0 No effect. 1 Busy.																																									
3	FMOD	Flash Memory Operation Mode Selection. 0001 "Flash page buffer reset mode" and start regardless of the flash operation rule. (Clear all 128bytes page buffer to 0xFFFFFFFF) 0010 "Flash page erase mode" and start when the flash operation rule is satisfied. 0100 "Flash page write mode" and start when the flash operation rule is satisfied. 1000 "Flash bulk erase mode" and start when the flash operation rule is satisfied. Others Not allowed. FMOPFLAG will be set.																																									
0																																											

**NOTES:**

1. During a flash memory operation mode, the all interrupts are on disable regardless of enable bits.
2. The FMKEY[7:0] and FMOD[3:0] bits are automatically cleared to logic "0x00" immediately after a single operation.

#### 4.3.1.5 FMC\_BCR: flash memory configure area bulk erase control register

FMC\_BCR register is used to permit bulk erase. This register is 32-bit size.

FMC_BCR=0x4000_1B10																																								
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

3	CNF1BEN	Configure Option Page 1 Bulk Erase Enable.																																						
0		0x5 Permit "configure option page 1" erase at bulk erase Others Protect "configure option page 1" erase at bulk erase																																						

**NOTE:** This register is automatically cleared to logic "0x00" immediately after one time operation.

#### 4.3.1.6 FMC\_ERFLAG: flash memory error flag register

FMC\_ERFLAG is 32-bit size, and accessible in 32/16/8-bit.

FMC_ERFLAG=0x4000_1B14																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved																										INSTFLAG	FMOPFLAG				
0x0000000																															
-																															
1	INSTFLAG	Don't care																													
0	FMOPFLAG	Error bit of Flash Memory Operation Procedure. This bit is set to logic 1 if there is a wrong procedure for flash memory operation.																													
		0 No wrong procedure.																													
		1 A wrong procedure occurred. The bit is cleared to '0' when '1' is written.																													

### 4.3.2 Procedure for flash memory operation

- The high frequency internal RC oscillator (HIRC) should be enabled by S/W for flash memory operation.
- The procedure will be cleared, the related registers will be reset, and FMOPFLAG will be set if wrong sequence is detected.
- The address range is 0x10000000 to 0x17FFFFFF when “flash memory area” is selected.
- The address range is 0x1FFFF000 to 0x1FFFFFF when “configure option area” is selected.
- If the CPU is in the flash memory, the CPU will halt while the flash memory is programmed.
- The “configure option page 0” won’t be erased at flash bulk erase mode.
- The “configure option page 1/2/3” can be erased at flash bulk erase mode if the CNFx BEN has correct values
- The CPU should not be in the flash memory area on flash bulk erase mode.
- A write to the flash related register is ignored during flash operation.
- An NMI source should not be selected during flash memory operation is activated.
- The LVR should be enabled during flash memory operation is activated (Recommended: 2.28V over).
- The global interrupt should be disabled.
- The CPU should not enter sleep and deep sleep mode during flash erase/write mode.

#### 4.3.2.1 Page Erase Procedure

1. Write 0xFFFFFFFF to FMC\_ADR when the register is equal to 0x5FFFFF80.
2. Write 0x08192A3B to FMC\_IDR1 register when the FMC\_ADR register is equal to 0x5FFFFFFF.
3. Write 0x4C5D6E7F to FMC\_IDR2 register when the FMC\_ADR register is equal to 0x5FFFFFFF.
4. Write 0x6C930001 to FMC\_CR register for page buffer reset when the FMC\_ADR register is equal to 0x5FFFFFFF.
5. Clear page buffer (128bytes) by writing 0xFFFFFFFF repeatedly during the FMC\_ADR register is 0x5FFFFFFF.
6. Write a page address to FMC\_ADR register.
7. Read and check the FMC\_IDR1 and FMC\_IDR2 registers in turn.
8. Write 0x6C93A402 (flash memory area) or 0x6C933802 (configure option area) to FMC\_CR register.
9. Check whether the FMBUSY bit is ‘0’ or not.
10. Verify the erased pages.

#### 4.3.2.2 Byte/Page Write Procedure

1. Write 0xFFFFFFFF to FMC\_ADR when the register is equal to 0x5FFFFF80.
2. Write 0x08192A3B to FMC\_IDR1 register when the FMC\_ADR register is equal to 0x5FFFFFFF.
3. Write 0x4C5D6E7F to FMC\_IDR2 register when the FMC\_ADR register is equal to 0x5FFFFFFF.

4. Write 0x6C930001 to FMC\_CR register for page buffer reset when the FMC\_ADR register is equal to 0xFFFFFFFF.
5. Write data to page buffer (any bytes) when the FMC\_ADR register is equal to 0xFFFFFFFF.
6. Write a page address to FMC\_ADR register.
7. Read and check the FMC\_IDR1 and FMC\_IDR2 registers in turn.
8. Write 0x6C93A404 (flash memory area) or 0x6C933804 (configure option area) to FMC\_CR register.
9. Check whether the FMBUSY bit is '0' or not.
10. Verify the written pages.

#### **4.3.2.3 Flash bulk Erase Procedure**

1. Write 0xFFFFFFFF to FMC\_ADR when the register is equal to 0x5FFFFF80.
2. Write 0x08192A3B to FMC\_IDR1 register when the FMC\_ADR register is equal to 0xFFFFFFFF.
3. Write 0x4C5D6E7F to FMC\_IDR2 register when the FMC\_ADR register is equal to 0xFFFFFFFF.
4. Write 0x6C930001 to FMC\_CR register for page buffer reset when the FMC\_ADR register is equal to 0xFFFFFFFF.
5. Write the value 0x5F9A30D7 to FMC\_ADR register.
6. Read and check the FMC\_IDR1 and FMC\_IDR2 register in turn.
7. Write 0x6C93A408 to FMC\_CR register.
8. Check whether the FMBUSY bit is '0' or not.
9. Verify all the pages of flash memory.

#### **4.3.2.4 Flash Bulk Erase Procedure Including Configure Option Area.**

1. Write 0xFFFFFFFF to FMC\_ADR when the register is equal to 0x5FFFFF80.
2. Write 0x08192A3B to FMC\_IDR1 register when the FMC\_ADR register is equal to 0xFFFFFFFF.
3. Write 0x4C5D6E7F to FMC\_IDR2 register when the FMC\_ADR register is equal to 0xFFFFFFFF.
4. Write 0x6C930001 to FMC\_CR register for page buffer reset when the FMC\_ADR register is equal to 0xFFFFFFFF.
5. Write the value 0xC1BE0VVV to FMC\_BCR register. If V==5, the corresponding option page will be erased.
6. Write the value 0x5F9A30D7 to FMC\_ADR register.
7. Read and check the FMC\_IDR1 and FMC\_IDR2 register in turn.
8. Write 0x6C93A408 to FMC\_CR register.
9. Check whether the FMBUSY bit is '0' or not.
10. Verify all the pages of flash memory.

## 4.4 Configure option area

Configuration option area of A31G12x series is used for system related trimming values, user option, and user data. The configure option area consists of four pages in the flash memory, which can be erased and written by the flash memory controller. This area can be read by any instruction.

The four pages of the configuration option area are listed in the followings:

- Page 0: System related trimming values
- Page 1: User option for read protection, watchdog timer, and LVR voltage level configurations
- Page 2: User data 0 area
- Page 3: User data 1 area

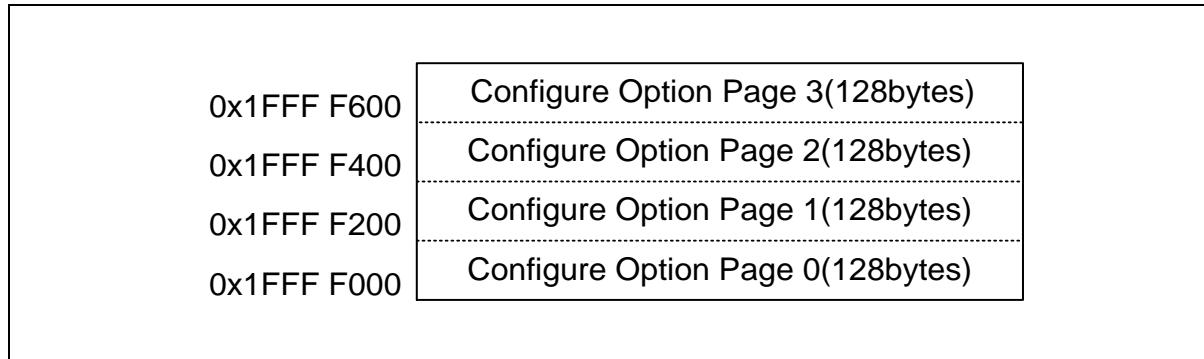

Figure 12. Configure Option Area Structure

### 4.4.1 Configuration option page

Base address of the configuration option area ranges from 0x1FFF\_F000 to 0x1FFF\_F600. The area map is shown in Table 11.

**Table 11. Configuration Option Area Map**

<b>Page</b>	<b>NAME</b>	<b>ADDRESS</b>	<b>DESCRIPTION</b>
<b>0</b>	-	0x1FFF_F000 to 0x1FFF_F07F	System Trimming Values
<b>1</b>	CONF_RPCNFIG	0x1FFF_F200	Configuration for Read Protection
	CONF_WDTCNFIG	0x1FFF_F20C	Configuration for Watch-Dog Timer

## 5 SCU (System Control Unit)

A31G12x series has a built-in intelligent power control block, which manages analog blocks and operating modes. Internal reset and clock signals are controlled by SCU block to maintain optimized system performance and power dissipation.

### 5.1 SCU block diagram

Figure 13 shows the SCU block diagram.

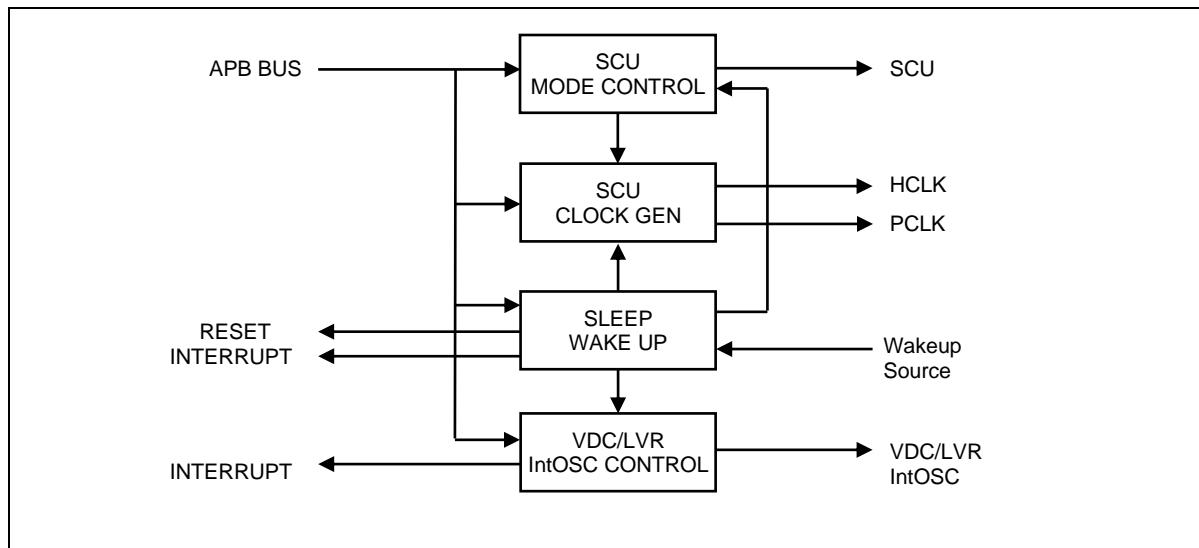

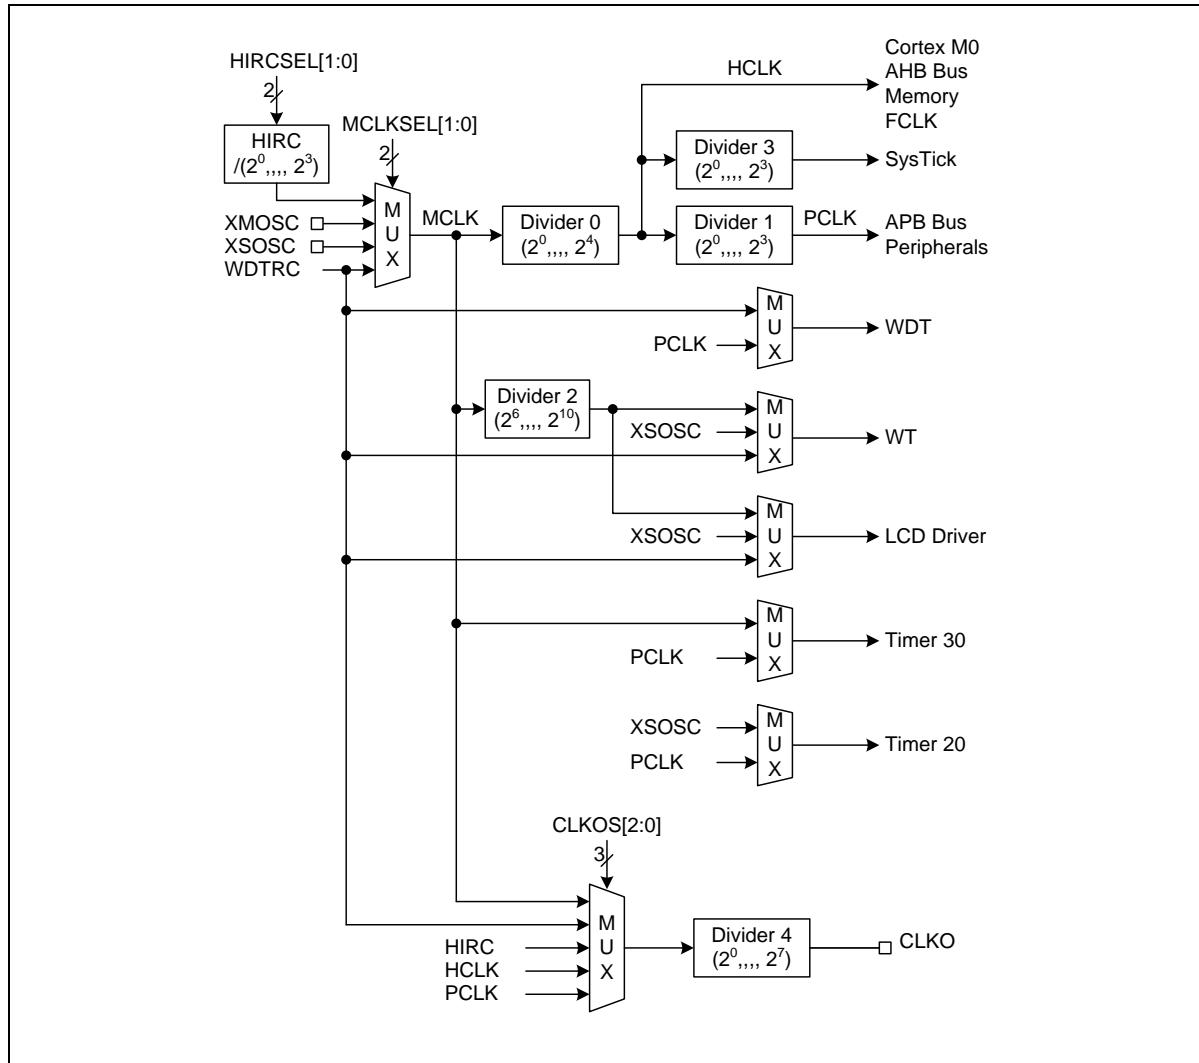

Figure 13. SCU Block Diagram

## 5.2 Clock system

A31G12x series has two main operating clocks. One is HCLK, which supplies the clock to the CPU and AHB bus system. The other one is PCLK, which supplies the clock to the peripheral systems.

Users can control the clock system variation by software. Figure 14 shows the clock system of A31G12x series and Table 12 shows the descriptions for clock sources.

**Figure 14. Clock Source Configuration**

Each mux to switch clock source has a glitch-free circuit. So a clock can be switched without glitch risks. When you change the clock mux control, be sure both clock sources are alive. If either is not alive, clock change operation stops and system will shut down and not recover.

**Table 12. Clock Sources**

Clock name	Mnemonic	Frequency	Description
Main OSC	XMOSC	<ul style="list-style-type: none"> <li>X-TAL (2MHz to 16MHz)</li> <li>External Clock (2MHz to 40MHz)</li> </ul>	<ul style="list-style-type: none"> <li>External Main Crystal OSC</li> <li>External Main Clock</li> </ul>
Sub OSC	XSOSC	X-TAL (32.768kHz)	External Sub Crystal OSC
Internal RC OSC	HIRC	2.5MHz to 40MHz	High Frequency Internal RC OSC
WDT RC OSC	WDTRC	40kHz	Watchdog Timer RC OSC

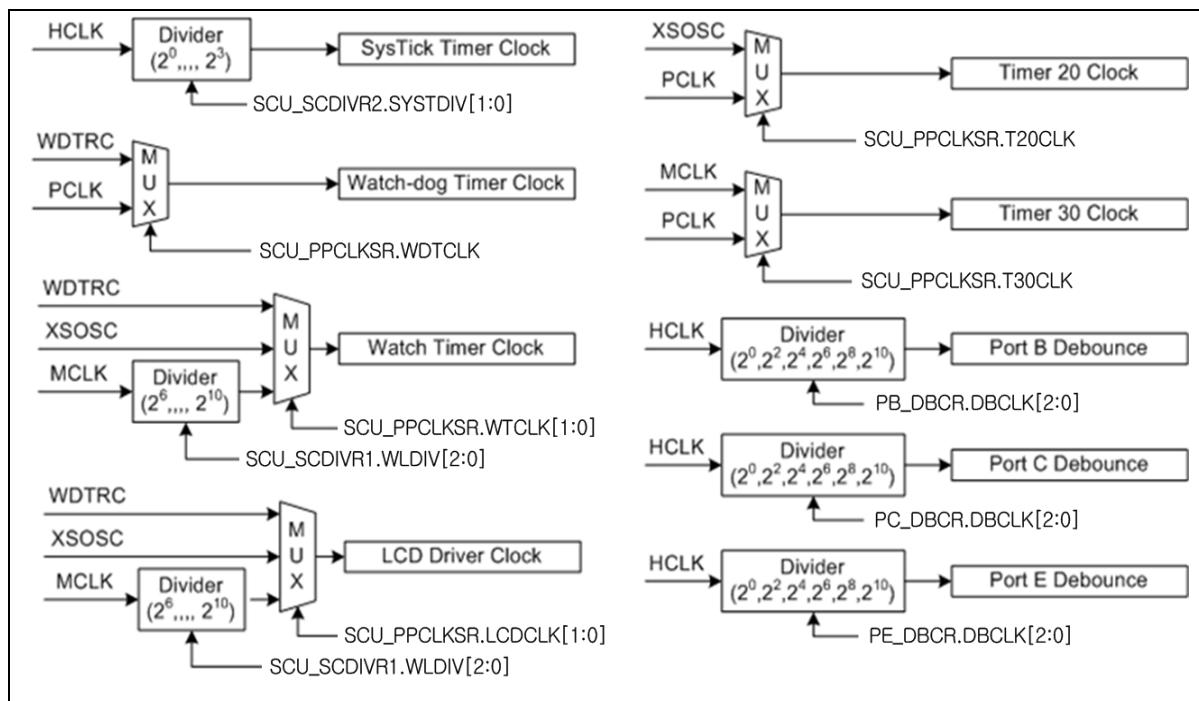

### 5.2.1 HCLK clock domain

HCLK clock feeds the clock to the CPU and AHB bus. Cortex-M0+ CPU requires 2 clocks, FCLK and HCLK. FCLK is a free running clock and is always running except during power down mode. HCLK can be stopped during sleep mode.

The HCLK clock operates the BUS system and memory systems. Max BUS operating clock speed is 40MHz. HCLK frequency should be limited to a frequency of 40MHz or lower.

### 5.2.2 Miscellaneous clock domain

Various clock sources are required for each functional block. The SCU provides clock source selectivity with dedicated pre-scaler for each functional block. The clock selection mux does not support glitch-free function, so the clock is unpredictable during clock selection. Figure 15 shows the configurations for miscellaneous clocks.

**Figure 15. Miscellaneous Clock Configuration**

### 5.2.3 PCLK clock domain

PCLK is the master clock for all the peripherals except for the CRC generator and ports. It can shut down during power down mode. Each peripheral clock is generated by SCU\_PPCLKEN1 and SCU\_PPCLKEN2 register set. Figure 14 illustrates the PCLK clock distributions. The peripherals are not accessible even by reading its registers until each PCLK clock of each block is enabled.

### 5.2.4 Clock configuration procedure

After power on the device, a default system clock is generated by HIRC (2.5MHz) clock. The HIRC is enabled by default during power up sequence. Other clock sources are enabled by user controls and configuration options with a system clock.

XMOSC and XSOSC clocks are enabled by XMOSCEN and XSOSCEN bits of SCU\_CLKSRCR register respectively. Before enabling XMOSC and XSOSC blocks, the pin mux configuration should be set for XIN/XOUT and SXIN/SXOUT functions. PF0/PF1 and PF2/PF3 pins are shared by XMOSC's XIN/XOUT function and XSOSC's SXIN/SXOUT function – PF\_MOD and PF\_AFSR1 registers should be configured properly.

After enabling the XMOSC and XSOSC blocks, a user can check stability of crystal oscillation through a clock monitoring control register, SCU\_CMONCR. It takes more than 1ms to ensure stable crystal oscillation before changing the system clock.

Figure 16 shows an example flow chart to configure the system clock to XMOSC and XSOSC clock.

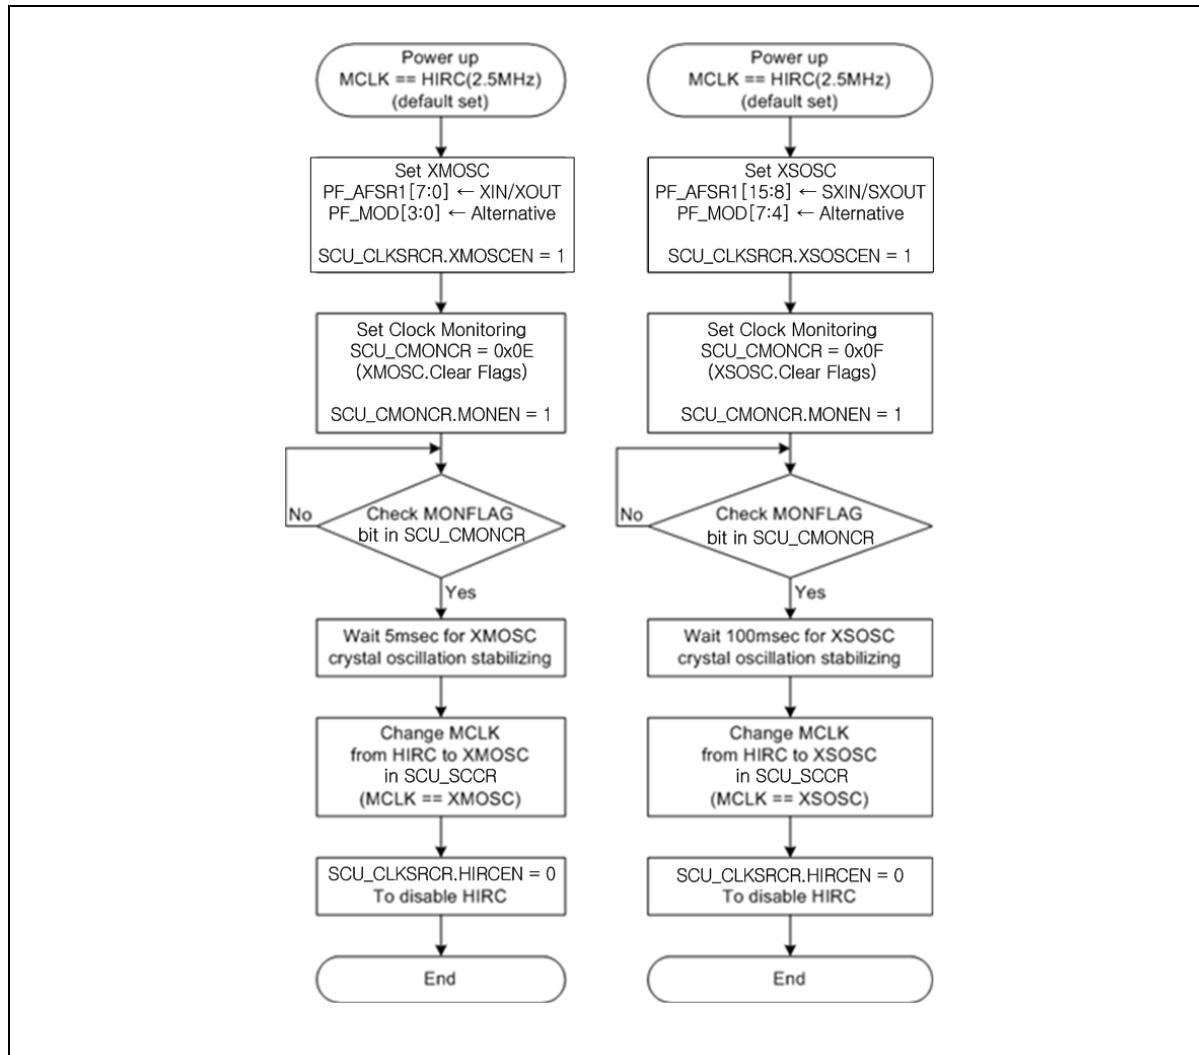

Figure 16. Clock Configuration Procedure

### 5.3 Reset

A31G12x series has two system resets. One is the cold reset by POR, which is effective during power up or down sequence. The other is the warm reset, generated by several reset sources. The reset event makes the device to turn back to its initial state.

The cold reset has only one reset source, which is POR, while the warm reset has several reset sources as shown below:

- nRESET pin
- WDT reset
- LVR reset
- MON reset
- S/W reset
- CPU request reset

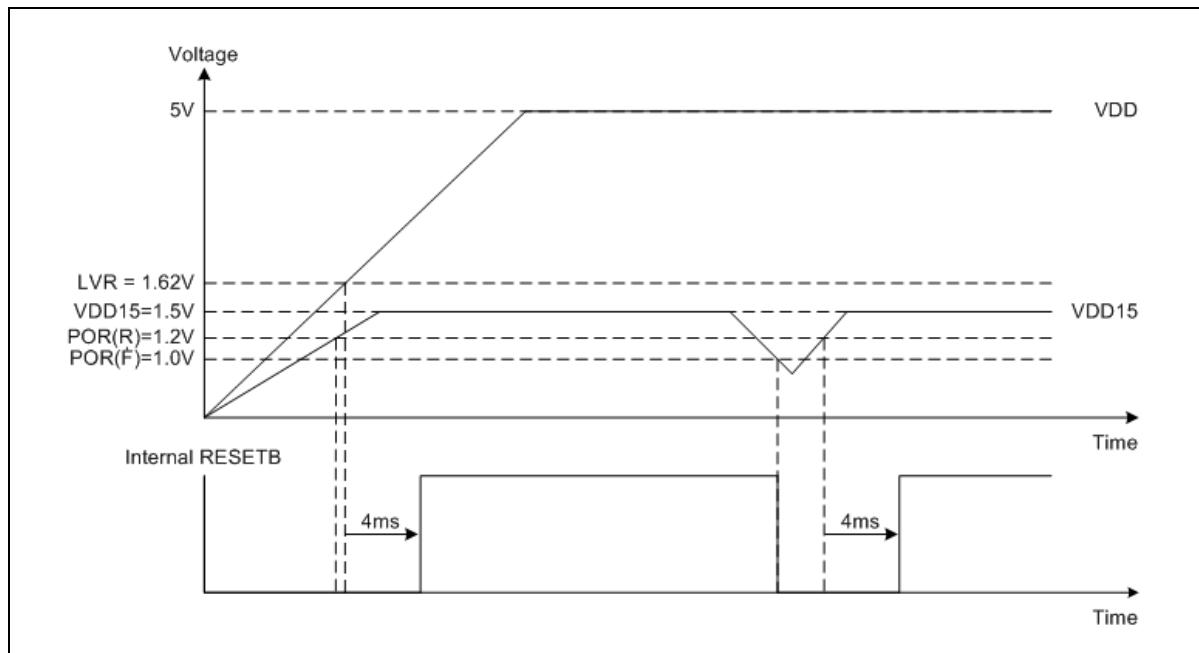

#### 5.3.1 Cold reset

The cold reset is one of important feature of the A31G12x series when it powers up. This characteristic will globally affect the system boot.

Internal VDC is enabled when VDD power is turned on. Internal VDD level slope follows the External VDD power slope. Internal POR trigger level is at 1.2V of the internal VDC voltage. At this time, boot operation begins.

Internal RC clock turns on and counts 4ms for internal VDC level to stabilize. At this time, external VDD voltage level should be bigger than initial LVR level (1.62V). After 4ms of counting, the CPU reset is released and operation begins.

Figure 17 shows waveform of power up sequence and internal reset.

**Figure 17. Power-up POR Sequence**

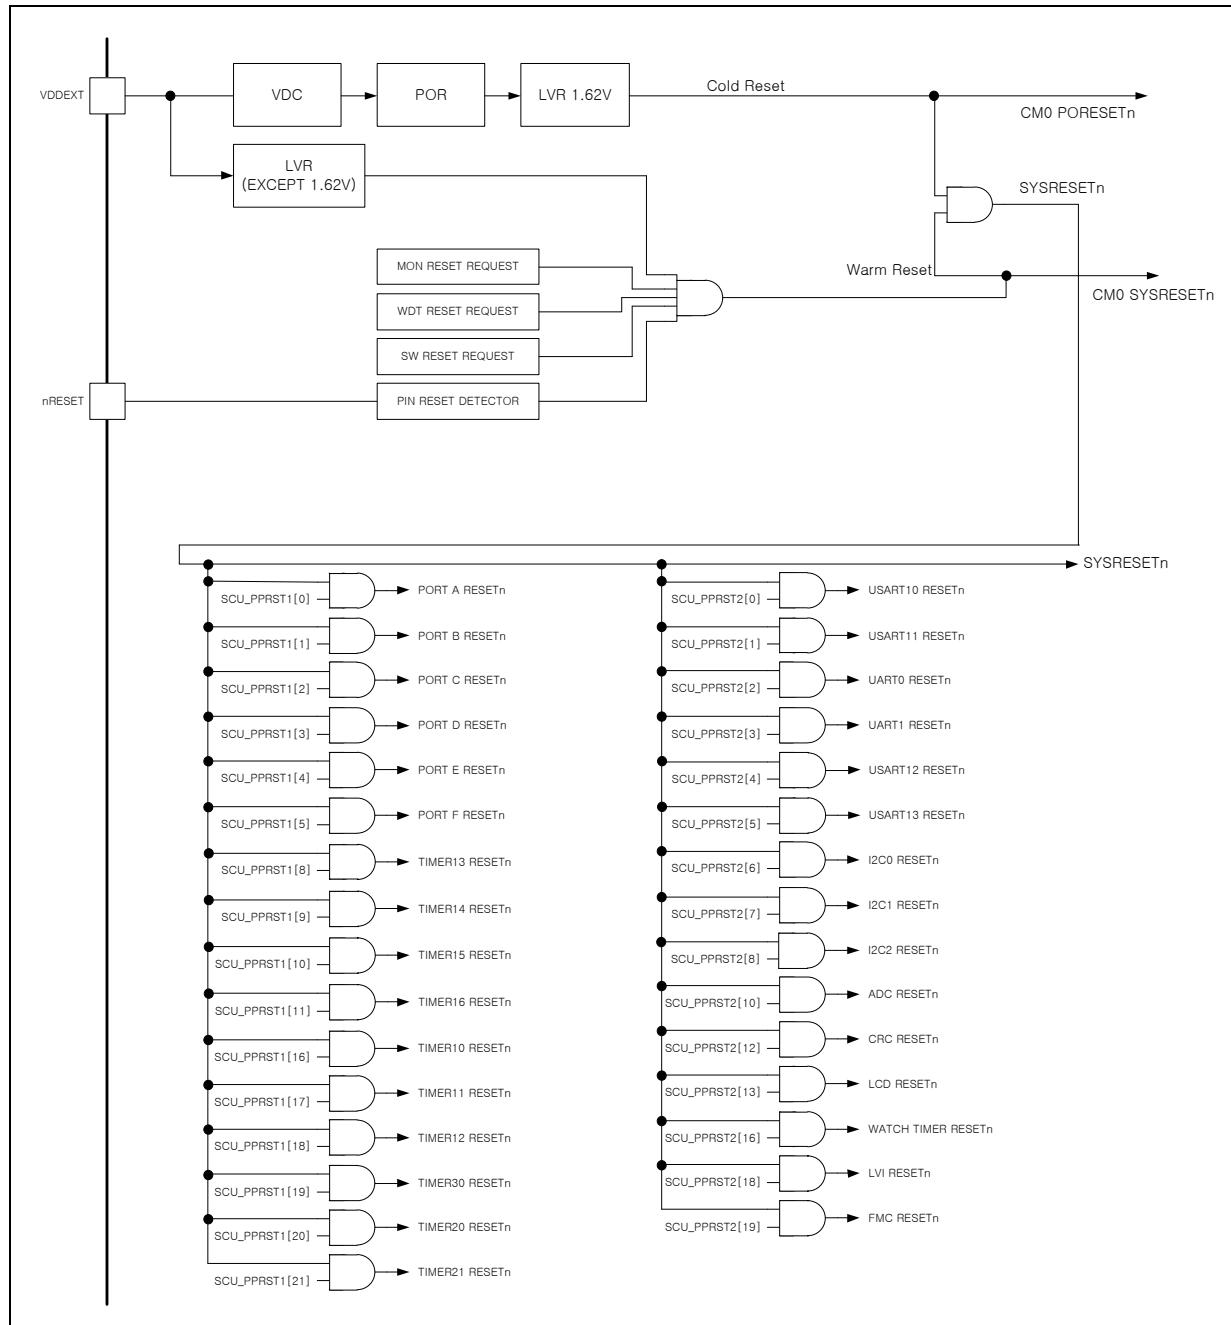

A register SCU\_RSTSSR shows the POR reset status. The last reset comes from the POR. SCU\_RSTSSR.PORSTA is set to '1'. After power on, this bit is always '1' if the bit is not cleared by S/W. If abnormal internal voltage drop is detected during normal operation, the system will be reset and this bit also will be set to '1'.

When the cold reset is applied, the entire device returns to its initial state.

### 5.3.2 Warm reset

The warm reset event has several reset sources and some parts of the device return to their initial states when the warm reset takes place.

The warm reset status appears in a register SCU\_RSTSSR. A reset for each peripheral block is controlled by a register SCU\_PPRST. The reset can be masked independently.

**Figure 18. Reset Configuration**

### 5.3.3 LVR reset

The LVR voltage level is set by a low voltage reset configuration register (CONF\_LVRCNFIG) in the configuration option page 1.

LVR reset status appears in a register SCU\_RSTSSR. The reset for LVR is controlled by a register SCU\_LVRCCR. The register is cleared to "0x00" on POR reset.

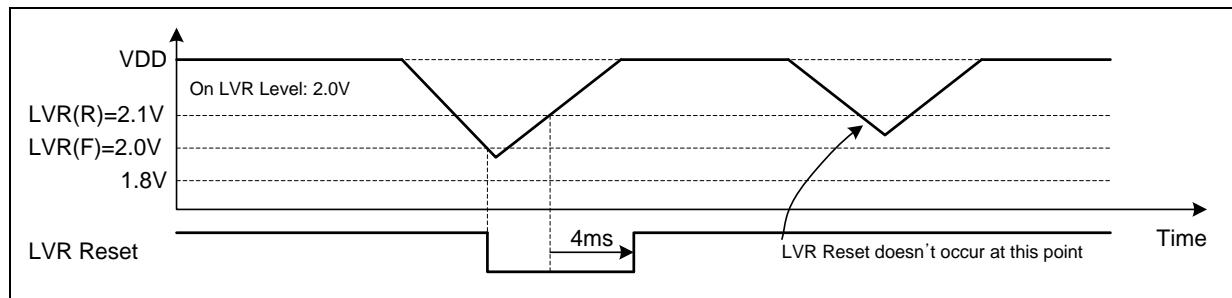

Figure 19. LVR Reset Timing Diagram

## 5.4 Operation mode

INIT mode is the initial state of the device when reset. At RUN mode, the chip runs at its max CPU performance with a high-speed clock system. At SLEEP and DEEP SLEEP mode, the chip runs at a low power consumption mode. The system saves power by halting the processor core and unused peripherals.

Figure 20 shows the operation mode transition diagram.

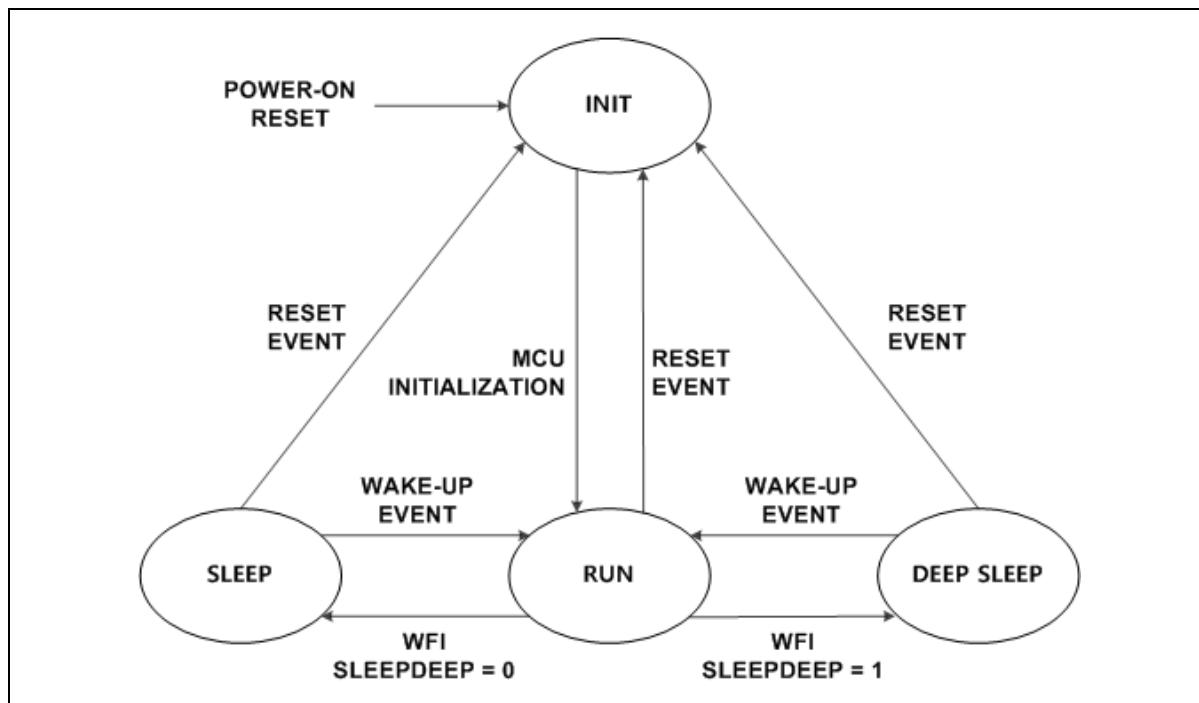

Figure 20. Operating Mode

### 5.4.1 Run mode

This mode is to operate CPU core and peripheral hardware with a high-speed clock. The device enters in the INIT state after reset, and then enters in the RUN mode.

### 5.4.2 Sleep mode

The device stops only CPU in this mode. Each peripheral function turns on by a function enable bit and a clock enable bit of the register SCU\_PPCLKEN.

### 5.4.3 Deep sleep mode

The device stops not only CPU but also a selected system clock (MCLK) in this mode. Watch timer with sub clock and watchdog timer with WDTRC still operate in this mode.

**Table 13. Functional table on current mode**

<b>IP</b>	<b>Main Run (IDD1)</b>	<b>Main Sleep (IDD2)</b>	<b>Sub Run (IDD3)</b>	<b>Sub Sleep (IDD4)</b>	<b>Deep Sleep (IDD5)</b>

### 5.6.3 SCU\_REVNR: revision number register

SCU\_REVNR register is a 32-bit read-only register. This register is accessible in 32/16/8-bit.

SCU_REVNR=0x4000_F008																																								
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0									
Reserved																									REVNO															
0x000000																									xx															
-																									RO															
7	REVNO	Chip Revision Number. This value is assigned by the manufacturer.																																						
0																																								

### 5.6.4 SCU\_PMREMAP: program memory remap register

SCU\_PMREMAP register is 32-bit size.

SCU_PMREMAP=0x4000_F014																15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
WTIDKY	nPMREM	PMREM																													
0x0000	0x00	0x00																													
WO	WO	RW																													

31	WTIDKY	Write Identification Key When writing, write 0xE2F1 to these bits, or else writing is ignored.
16	nPMREM	Write Complement Key When writing, write the complement value of PMREM[7:0], or else writing is ignored.
8	PMREM	Program Memory Remap.
0	0x69	Boot ROM is re-mapped to address 0x00000000. 0x10001000 of Flash memory is re-mapped to address 0x00001000.
Others		Flash memory is re-mapped to address 0x00000000.
<b>NOTE:</b> The remapped program memory can be accessed from the original address.		

### 5.6.5 SCU\_BTPSCR: boot pin status and control register

SCU\_BTPSCR register is 32-bit size and accessible in 32/16/8-bit.

SCU_BTPSCR=0x4000_F018																15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved																Reserved	BFind	Reserved				BTPSTA									
0x000000																0	xx	0000				x									
-																-	RW	-				RO									

6	BFIND	BOOT Pin Function Indicator. The BFIND[1:0] bits are cleared to "00" by POR, the BFIND[1] bit is cleared to '0' by nRESET, and the bits are not cleared by other system reset. One of the two of the following must be set in the BFIND[1:0] bits to check whether ISP is needed or not.
5		10 Check the BOOT pin when the system resets by nRESET including POR.
		11 Check the BOOT pin when the system resets only by POR.
0	BTPSTA	BOOT Pin Status.
		0 The BOOT pin is low level.
		1 The BOOT pin is high level.
		Note) This bit is always '1' if the BOOT pin is not selected for alternative function.

**NOTE:** When a system reset occurs, the PB3 pin is configured as alternative function for BOOT, the pull-up resistor is enabled, and the debounce filter is enabled.

### 5.6.6 SCU\_RSTSSR: reset source status register

SCU\_RSTSSR register shows reset source information when reset event is occurred. '1' implies a reset event exists, while '0' means a reset event does not exist for a corresponding reset source.

When a reset source is detected, '1' is written into the corresponding bit position and reset status will be cleared.

SCU\_RSTSSR register is 32-bit size and accessible in 32/16/8-bit.

SCU_RSTSSR=0x4000_F01C																7	6	5	4	3	2	1	0								
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved																Reserved	MONSTA	SWSTA	EXTSTA	WDTSTA	LVRSTA	PORSTA									
0x000000																00	x	x	x	x	x	x	x	x	x	x	x	x	x	x	
-																-	I	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	
5	MONSTA	Clock Monitoring Reset Status.														0	Not detected														
		0 Not detected														1	Clock monitoring reset is detected. The bit is cleared to '0' when '1' is written.														
4	SWSTA	Software Reset Status.														0	Not detected														
		0 Not detected														1	Software reset is detected. The bit is cleared to '0' when '1' is written.														
3	EXTSTA	External Pin Reset Status.														0	Not detected														
		0 Not detected														1	External pin reset is detected. The bit is cleared to '0' when '1' is written.														
2	WDTSTA	Watchdog Timer Reset Status.														0	Not detected														
		0 Not detected														1	Watchdog timer reset is detected. The bit is cleared to '0' when '1' is written.														
1	LVRSTA	LVR Reset Status.														0	Not detected														
		0 Not detected														1	LVR reset is detected. The bit is cleared to '0' when '1' is written.														
0	PORSTA	POR Reset Status.														0	Not detected														
		0 Not detected														1	POR reset is detected. The bit is cleared to '0' when '1' is written.														

#### NOTES:

1. The PORSTA bit is set to '1' and the other bits are cleared to '0' when power-on reset occurs.
2. The corresponding reset status bit may be set to '1' if any reset signal is asserted during power-on reset takes place. For example, The EXTSTA bit may be set if the external reset is asserted during POR.

### 5.6.7 SCU\_NMISRCR: NMI source selection register

SCU\_NMISRCR is the non-maskable interrupt configuration register, which can be set by software. SCU\_NMISRCR register is 32-bit size, and accessible in 32/16/8-bit.

SCU_NMISRCR=0x4000_F020																																			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

8		When writing, write the complement value of LSB(CTRMW+FTRMW), otherwise the write is ignored.																																		
7	CTRMW	Factory WDTRC Coarse Trim.																																		
4		These bits are fixed by manufacturer and read from "Configure Option Page 0" when the system resets. These bits provide a user-programmable trimming value on operation. The range is -8 to +7, the CTRMW[3] is sign bit, and the frequency is changed by about 4kHz steps.																																		
2	FTRMW	Factory WDTRC Fine Trim.																																		
0		These bits are fixed by manufacturer and read from "Configure Option Page 0" when the system resets. These bits provide a user-programmable trimming value on operation. The range is -4 to +3, the FTRMW[2] is sign bit, and the frequency is changed by about 1.1kHz steps.																																		

### 5.6.14 SCU\_SCCR: system clock control register

A31G12x series has multiple clock sources to generate internal operating clocks. SCU\_SCCR register controls such a clock source.

This register is 32-bit size.

**SCU\_SCCR=0x4000\_1800**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

31	WTIDKY	Write Identification Key
16		When writing, write 0x570A to these bits, or else writing is ignored.
1	MCLKSEL	Main Clock Selection, MCLK
0		00 High frequency Internal RC oscillator (40MHz), HIRC
		01 External main oscillator (2 – 40MHz), XMOSC
		10 External sub oscillator (32.768kHz), XSOSC
		11 Internal watchdog timer RC oscillator (40kHz), WDTRC

**NOTES:**

1. The MCLKSEL bits will not be changed on selecting the clock which is disabled by SCU\_CLKSRCR register.
2. If the MCLKSEL bits are “10” or “11”, the HDIV[2:0] bits of SCU\_SCDIVR1 register should be “100” for non-divided system clock.

### 5.6.15 SCU\_CLKSRCR: clock source control register

A31G12x series has multiple clock sources to generate internal operating clocks. SCU\_CLKSRCR register controls each clock source.

This register is 32-bit size.

SCU\_CLKSRCR=0x4000\_1804

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

		11 5MHz HIRC
8	XMFNRNG	Main Oscillator Type and Frequency Range Selection bit
		0 x-tal for XMOSC, 2 to 16MHz
		1 External clock for XMOSC, 2MHz to 40MHz
3	WDTRCEN	WDTRC Enable bit, Watchdog timer RC oscillator
		0 Disable WDTRC
		1 Enable WDTRC
2	HIRCEN	HIRC Enable bit, High frequency internal RC oscillator
		0 Disable HIRC
		1 Enable HIRC
1	XMOSCEN	XMOSC Enable bit, External main oscillator
		0 Disable XMOSC
		1 Enable XMOSC
0	XSOSCEN	XSOSC Enable bit, External sub oscillator
		0 Disable XSOSC
		1 Enable XSOSC

**NOTE:** The clock selected as a main system clock by SCU\_SCCR register will not be changed by the corresponding bit.

### 5.6.16 SCU\_SCDIVR1: system clock divide register 1

SCU\_SCDIVR1 register is 32-bit size and accessible in 32/16/8-bit.

SCU_SCDIVR1=0x4000_1808																																																						
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

	100	PCLK
	others	Reserved (None)

### 5.6.19 SCU\_CMONCR: clock monitoring control register

Internal clock can be monitored by using internal WDTRC for security purpose.

SCU\_CMONCR register is 32-bit size and accessible in 32/16/8-bit.

**SCU\_CMONCR=0x4000\_1814**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Reserved																																
0x000000																									0	0	0	0	0	0	0	0
-																									RW	RW	-	RW	RW	RW	RW	

7	MONEN	Clock Output Enable bit
0		Disable clock monitoring
1		Enable clock monitoring
<b>NOTE:</b> When this bit is reset to '0', the block clears the 4/7-bit counter, inFLAG, and flags.		
6	MACTS	Clock Monitoring Action Selection bits
5		00 No action by clock monitoring, but flags will be set/cleared on condition
	01	Reset generation by clock monitoring
	10	The system clock will be changed to the WDTRC regardless of MCLKSEL[1:0] bits of system clock control register (SCU_SCCR) only when the MCLK is selected for monitoring.
	11	Not used
3	MONFLAG	Clock Monitoring Result Flag bit
	0	The clock under monitoring is not ready.
	1	The clock under monitoring is ready. This bit is cleared to '0' when '1' is written.
2	NMINTFG	Clock Monitoring Interrupt Flag bit (only when the MCLK is selected for monitoring)
	0	No request occurred
	1	Request occurred. The bit is cleared to '0' when '1' is written.
<b>NOTE:</b> When the bit is set, the system clock must be switched to WDTRC by S/W.		
1	MONCS	Monitored Clock Selection bits
0		00 MCLK
	01	HIRC
	10	XMOSC
	11	XSOSC

**NOTES:**

1. The block should be enabled after disable to clear the internal status for new clock monitoring.
2. This block must be disabled by S/W before entering deep sleep mode.
3. When the "clock monitoring" function is disabled by S/W, the following sequence is required.
  - First, the MACTS bits should be cleared to "00b".
  - Second, the MONEN bit must be cleared to "0b".

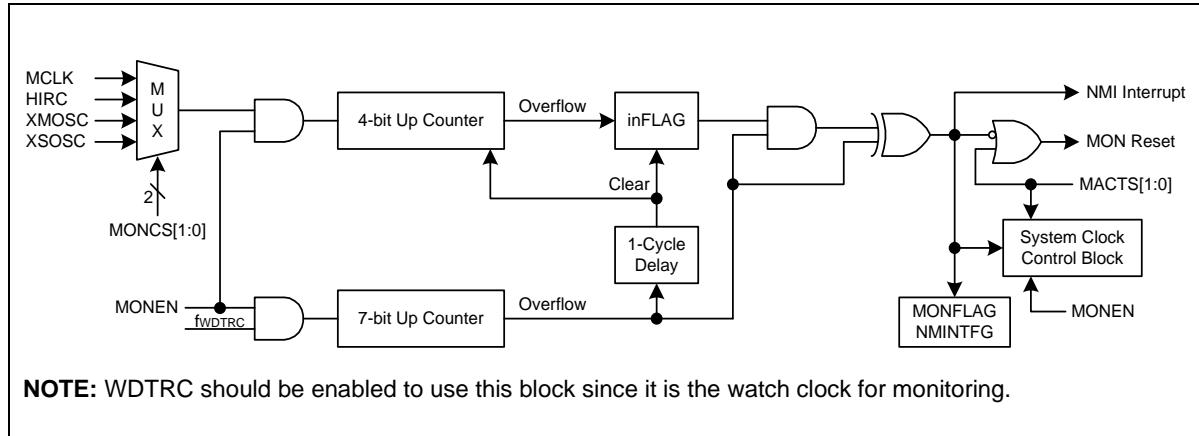

Figure 22. Clock Monitoring Circuit Diagram

### 5.6.20 SCU\_PPCLKEN1: peripheral clock enable register 1

To use a certain peripheral unit, its clock should be activated by writing '1' to the corresponding bit in SCU\_PPCLKEN1/SCU\_PPCLKEN2 register. Until enabling the clock, the peripheral does not operate properly. To stop the clock of the peripheral unit, write '0' to the corresponding bit in the SCU\_PPCLKEN1/PPCLKEN2 register.

SCU\_PPCLKEN1 register is 32-bit size and accessible in 32/16/8-bit.

SCU\_PPCLKEN1=0x4000\_1820

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### 5.6.25 SCU\_XTFLSR: X-tal filter selection register

SCU\_XTFLSR register is used to improve noise immunity of the main x-tal. This register should be set to a proper value for corresponding x-tal frequency.

SCU\_XTFLSR register is 32-bit size and accessible in 32/16/8-bit.

SCU\_XTFLSR=0x4000\_1880

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

0	0x55	Disable low voltage reset.																													
	Others	Enable low voltage reset.																													

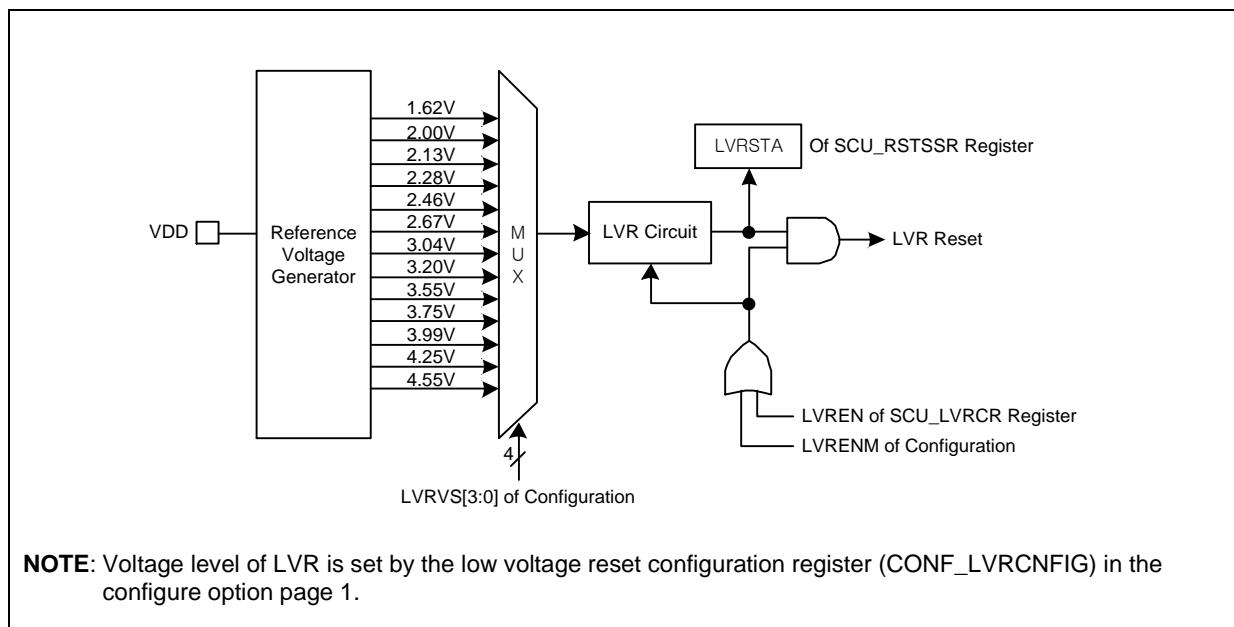

Figure 24. LVR Block Diagram

## 6 PCU and GPIO

PCU (Port Control Unit) configures and controls external I/Os as shown below:

- It configures direction of an external signal of each pin.
- It sets Interrupt trigger mode for each pin.
- It manages internal pull-up and pull-down register control and open drain control.

Most pins, except for dedicated function pins, can be used as GPIO (General Purpose I/O) ports. The GPIO block controls the GPIO as shown below:

- It selects output signal level (H/L).
- It controls external interrupt interface.
- It enables or disables the pull-ups and the pull-downs.

### 6.1 PCU and GPIO block diagrams

	10	–	T13OUT	T13CAP	–	–
	11	–	T14OUT	T14CAP	–	–

**NOTES:**

1. An unused pin shouldn't be configured as an input floating.
2. After reset, the PB3 pin is configured as BOOT alternative function and the internal pull-up is activated.
3. After reset, the PB4 and PB5 pins are configured as SWCLK and SWDIO alternative functions, and the internal pull-down on SWCLK and the internal pull-up on SWDIO are activated.
4. The PE3 – PE7 are automatically configured as common or segment signal according to the duty of the LCD control register when the pins are selected as alternative functions for common/segment.
5. The SWCLK and SWDIO pins shouldn't be changed as other alternative functions by software during the pins are connected with debugger host.

## 6.4 Registers

Base address and register map of PCU and GPIO block are shown in Table 22 and Table 23.

**Table 22. Base Address of Port**

Port name	Address range	Size (bytes)	Description
PA	0x3000 0000 – 0x3000 00FF	256	General Purpose I/O Port A
PB	0x3000 0100 – 0x3000 01FF	256	General Purpose I/O Port B
PC	0x3000 0200 – 0x3000 02FF	256	General Purpose I/O Port C
PD	0x3000 0300 – 0x3000 03FF	256	General Purpose I/O Port D
PE	0x3000 0400 – 0x3000 04FF	256	General Purpose I/O Port E
PF	0x3000 0500 – 0x3000 05FF	256	General Purpose I/O Port F

**Table 23. PCU and GPIO Register Map**

Name	Offset	Type	Description	Reset Value
Pn_MOD	0x0000	RW	Port n mode register	0x00000000

Pn_OUTDMSK	0x0024	RW	Port n output data mask register	0x00000000
Pn_DBCR	0x0028	RW	Port n debounce control register	0x00000000

**NOTES:**

1. Where n=A, B, C, D, E, and F.
2. For exception, the reset value of PB\_MOD, PB\_AFSR1, PB\_PUPD, PB\_DBCR register is 0xA80, 0x0021000, 0x0640, 0x0008 respectively.

#### 6.4.1 Pn\_MOD: port n mode register

Pn\_MOD register selects one from input mode and output mode for each port pin. Each pin can be configured as an input pin, an output pin or an Alternative Function pin.

This register is 32-bit size and accessible in 32/16/8-bit. (n = A to F).

PA_MOD=0x3000_0000, PB_MOD=0x3000_0100, PC_MOD=0x3000_0200 PD_MOD=0x3000_0300, PE_MOD=0x3000_0400, PF_MOD=0x3000_0500																15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW		
2x+1      MODEx      Port n Mode Selection bits, x: 0 to 15																															
2x																00	Input mode														
																01	Output mode														
																10	Alternative function mode														
																11	Reserved														

#### NOTES:

1. The MODEx bits for PF0 – PF3 won't be changed while the corresponding clock (XMOSC/XSOSC) is working as the system clock (MCLK).
2. For exception, 0xA80 is the reset value of PB\_MOD register for alternative function of SWDIO, SWCLK, and BOOT pins.

#### 6.4.2 Pn\_TYP: port n output type selection register

Pn\_TYP register selects an output type of a port pin from Push-pull output and Open-drain output.

This register is 32-bit size and accessible in 32/16/8-bit. (n = A to F)

PA_TYP=0x3000_0004, PB_TYP=0x3000_0104, PC_TYP=0x3000_0204 PD_TYP=0x3000_0304, PE_TYP=0x3000_0404, PF_TYP=0x3000_0504																15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

2x+1	PUPDx	Port n Pull-up/down Resistor Selection bits, x: 0 to 15
2x	00	Disable pull-up/down resistor
	01	Enable pull-up resistor
	10	Enable pull-down resistor
	11	Reserved

##### NOTES:

- The pull-up/down resistor of PF0 – PF3 are automatically disabled regardless of the corresponding PUPDx value if the pins are configured as alternative function pins for x-tal (XIN, XOUT, SXIN, and SXOUT).
- For exception, 0x0000\_0640 is the reset value of PB\_PUPD register for pull-up resistor of SWDIO/BOOT and pull-down resistor of SWCLK.

#### 6.4.10 Pn\_INDR: port n input data register

Each pin level status can be read in the Pn\_INDR register. Except for analog input and alternative mode output, the pin level can be detected in the Pn\_INDR register.

This register is 32-bit size and accessible in 32/16/8-bit. (n = A to F).

PA_INDR=0x3000_0014, PB_INDR=0x3000_0114, PC_INDR=0x3000_0214 PD_INDR=0x3000_0314, PE_INDR=0x3000_0414, PF_INDR=0x3000_0514

x INDRx Port n Input Data bit, x: 0 to 15

#### 6.4.11 Pn\_OUTDR: port n output data register

When a pin is set as an output in GPIO mode, output level of the pin is defined by Pn\_OUTDR registers.

This register is 32-bit size and accessible in 32/16/8-bit. (n = A to F).

PA_OUTDR=0x3000_0018, PB_OUTDR=0x3000_0118, PC_OUTDR=0x3000_0218 PD_OUTDR=0x3000_0318, PE_OUTDR=0x3000_0418, PF_OUTDR=0x3000_0518
--

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

0x0000								-	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW										

x OUTDRx Port n Output Data bit, x: 0 to 15.  
The OUTDR bits can be individually set/cleared by writing to the Pn\_BSR/Pn\_BCR register.

#### 6.4.12 Pn\_BSR: port n output bit set register

Pn\_BSR are used for controlling each bit of the Pn\_OUTDR register. Writing a '1' into the specific bit position will set a corresponding bit of Pn\_OUTDR to '1'. Writing '0' in the register has no effect.

This register is 32-bit size and accessible in 32/16/8-bit. (n = A to F)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

0x0000								-	WO	WO	WO	WO	WO	WO	WO	WO	WO	WO	WO	WO	WO										

x BSRx Port n Output Set bit, x: 0 to 15. These bits are always read to 0x00.  
0 No effect  
1 Set the corresponding OUTDRx bit (Automatically cleared to 0)

#### 6.4.13 Pn\_BCR: port n output bit clear register

Pn\_BCR are used for controlling each bit of Pn\_OUTDR register. Writing a '1' into the specific bit will set a corresponding bit of Pn\_OUTDR to '0'. Writing '0' in this register has no effect.

This register is 32-bit size and accessible in 32/16/8-bit. (n = A to F).

PA\_BCR=0x3000\_0020, PB\_BCR=0x3000\_0120, PC\_BCR=0x3000\_0220  
PD\_BCR=0x3000\_0320, PE\_BCR=0x3000\_0420, PF\_BCR=0x3000\_0520

																WO	WO	WO	WO	WO	WO	WO	WO	WO	WO	WO	WO	WO	WO	WO	WO	WO	
																-																	

x	BCRx	Port n Output Clear bit, x: 0 to 15. These bits are always read to 0x00.
	0	No effect
	1	Clear the corresponding OUTDRx bit (Automatically cleared to 0)

#### 6.4.14 Pn\_OUTDMSK: port n output data mask register

Pn\_OUTDMSK are used for protecting each bit of Pn\_OUTDR register. Writing a '1' into the specific bit will protect a corresponding bit of Pn\_OUTDR. Writing '0' in this register is unmask.

This register is 32-bit size and accessible in 32/16/8-bit. (n = A to F).

PA\_OUTDMSK=0x3000\_0024, PB\_OUTDMSK=0x3000\_0124, PC\_OUTDMSK=0x3000\_0224  
PD\_OUTDMSK=0x3000\_0324, PE\_OUTDMSK=0x3000\_0424, PF\_OUTDMSK=0x3000\_0524

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

x	DBENx	Port n Debounce Enable bit, x: 0 to 11.
	0	Disable debounce filter
	1	Enable debounce filter

**NOTES:**

1. If a level is not detected on an enabled pin three or more times in a row at the sampling clock, the signal is eliminated as noise.
  2. The port debounce should be disabled before deep sleep mode.
  3. The A31G12x series has debounce filters for only PB0 – PB11, PC0 – PC3, and PE0 – PE3.
  4. The debounce of the BOOT Pin enables on system reset.
  5. For exception, 0x08 is the reset value of PB\_DBCR register.

## 6.5 Functional description

When input function of an I/O port is used by the Pin Control Register, output function of the I/O port is disabled.

Each port function is configured by the Alternative Function Selection Register respectively.

The Input Data Register captures current data on the I/O pin or debounced input data at every GPIO clock cycle.

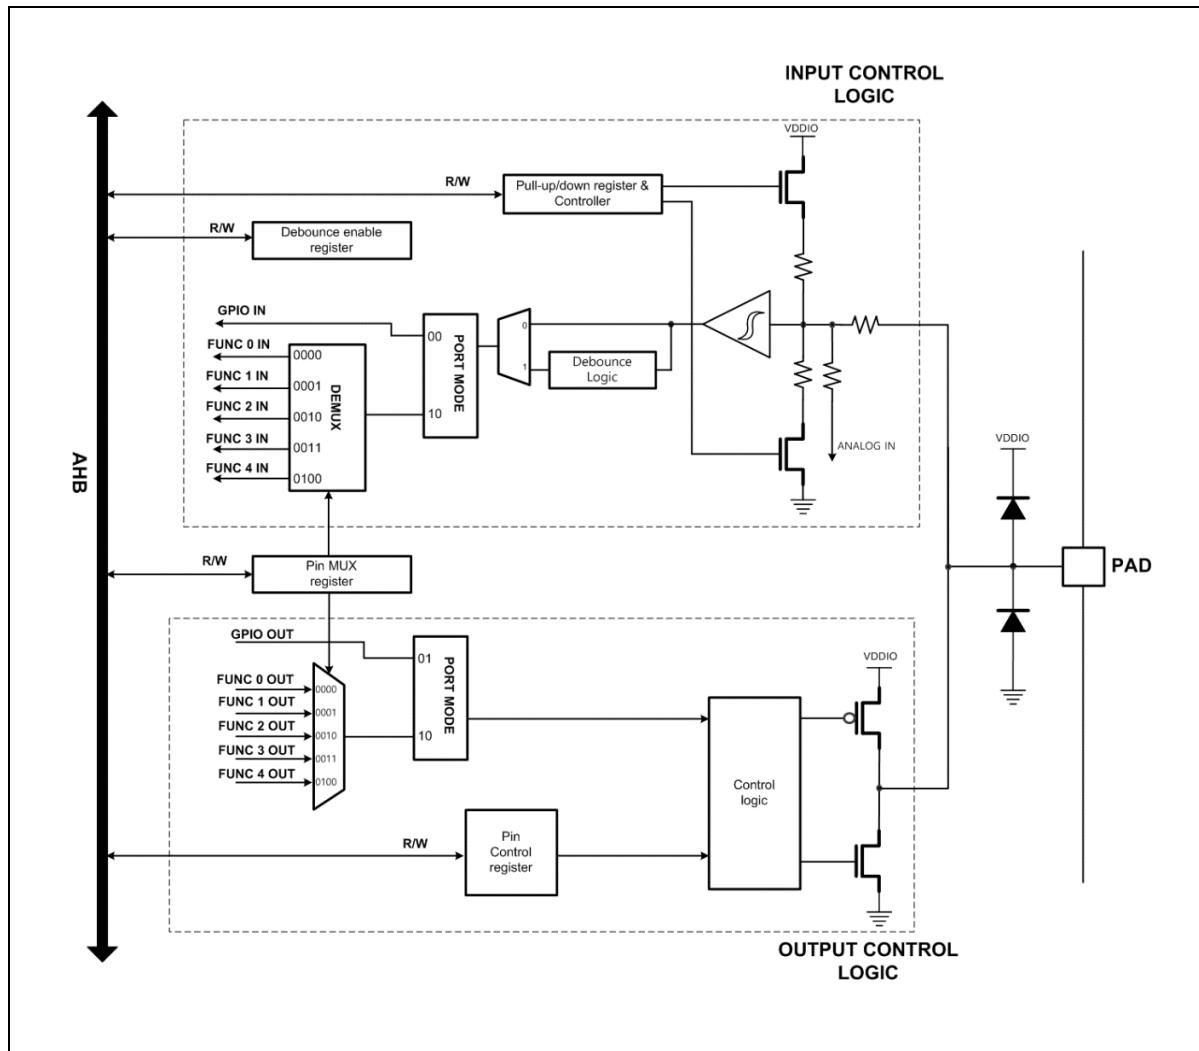

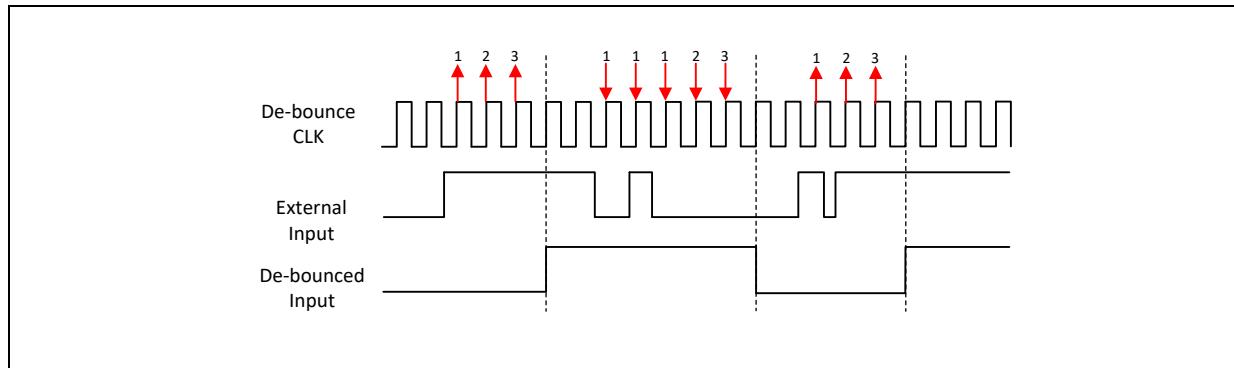

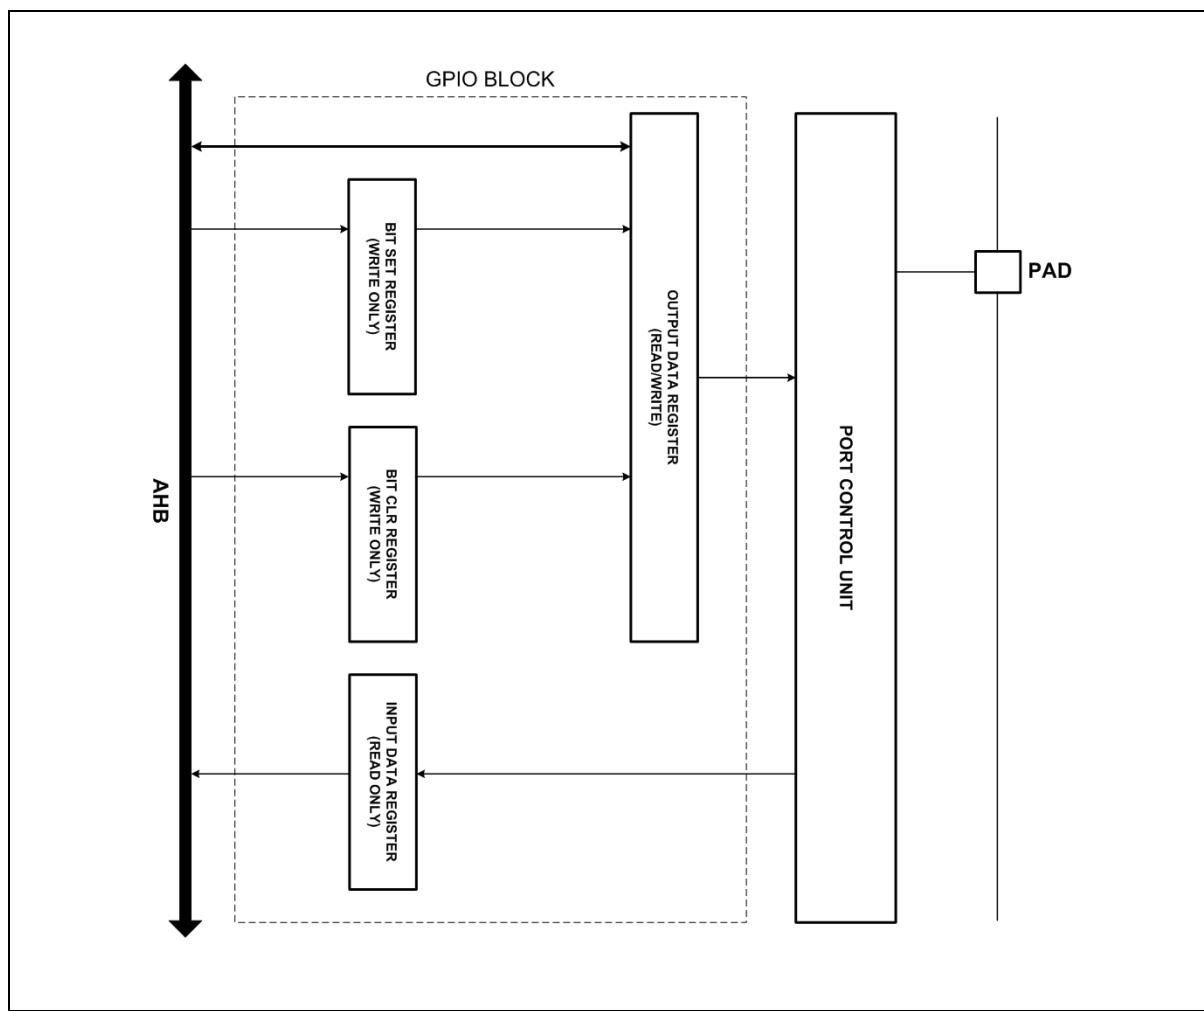

Figure 29. Port Structure Block Diagram

**Figure 30. Debounce Function Timing Diagram**

When an I/O port is configured as an output, the value written to the GPIO Output Data Register is output on the I/O Pin. When the Bit Set Register is set, the GPIO Output Data Register is set to High. When the Bit Clr Register is set, the GPIO Output Data Register is set to Low. The Input Data Register captures current data on the I/O pin or debounced input data at every GPIO clock cycle.

**Figure 31. GPIO Block Diagram**

## 7 WDT

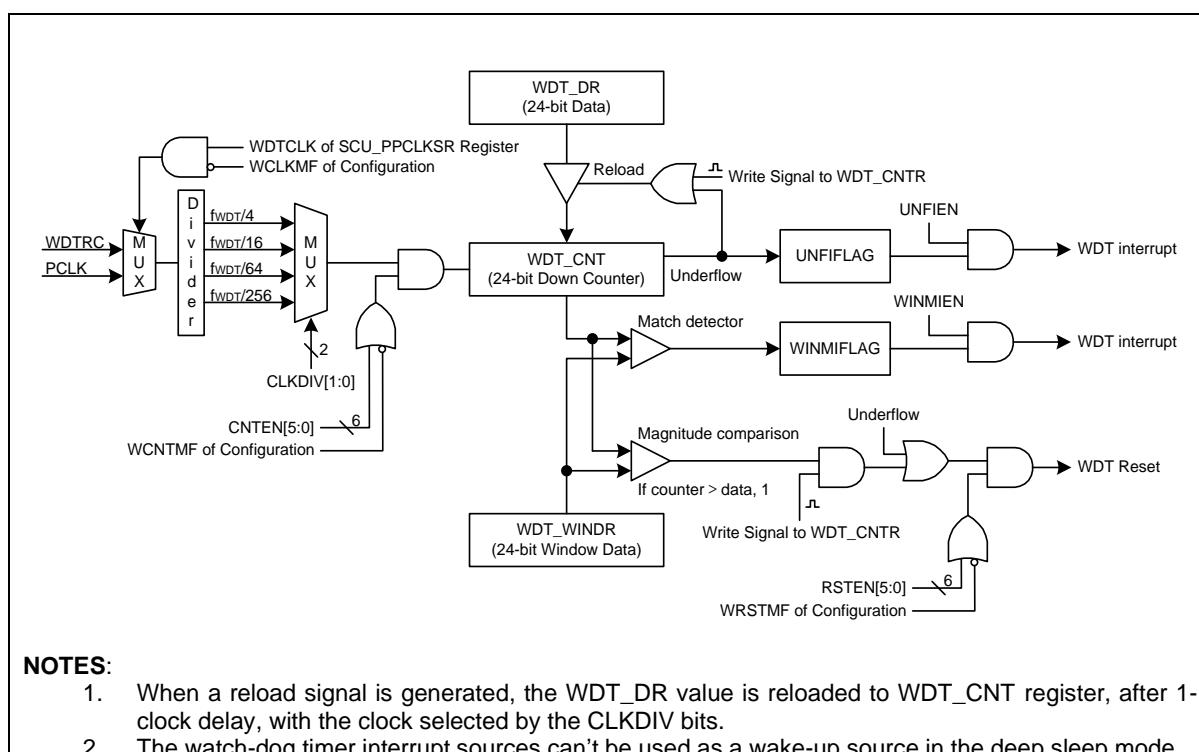

WDT (Watchdog Timer) rapidly detects CPU malfunctions such as endless loops caused by noise and returns the CPU to the normal state. WDT signal for malfunction detection can be used as either a CPU reset or an interrupt request.

When the WDT is not being used for malfunction detection, it can be used as a timer to generate interrupts at fixed intervals. When WDT\_CNT value reaches WDT\_WINDR value, a watchdog interrupt can be generated. The underflow time of the WDT can be set by WDT\_DR. If an underflow occurs, an internal reset may be generated. The WDT operates at 40kHz which is the embedded RC oscillator's clock.

WDT operations are listed in the followings:

- 24-bit down counter (WDT\_CNT)
- Reset or periodic interrupt selection
- Count clock selection
- Watchdog overflow output signal
- Counter window function

### 7.1 WDT block diagram

#### NOTES:

1. When a reload signal is generated, the WDT\_DR value is reloaded to WDT\_CNT register, after 1-clock delay, with the clock selected by the CLKDIV bits.
2. The watch-dog timer interrupt sources can't be used as a wake-up source in the deep sleep mode.

Figure 32. WDT Block Diagram

## 7.2 Registers

Base address and register map of WDT are shown in Table 30 and Table 31.

**Table 30. Base Address of WDT**

Name	Base address
WDT	0x4000_1A00

**Table 31. WDT Register Map**

23	DATA	Watchdog Timer Data. The range is 0x000000 to 0xFFFFFFF.																									0							
		NOTE: Once any value is written to this data register, the register cannot be changed until system reset.																																

### 7.2.4 WDT\_CNT: watchdog timer counter register

WDT\_CNT register represents current count value of the 32-bit down counter. When the counter value reaches 0, an interrupt or a reset will be asserted.

This register is 32-bit size.

WDT_CNT=0x4000_1A0C																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

-																RW																															
23	WDATA	Watchdog Timer Window Data. The range is 0x000000 to 0xFFFFFFF.																																													
0																																															

**NOTE:** Once any value is written to this window data register, the register cannot be changed until system reset.

### 7.2.6 WDT\_CNTR: watchdog timer counter reload register

WDT\_CNTR register is used to generate a reload signal. When a reload signal is generated, the WDT\_DR value is reloaded to WDT\_CNT.

This register is 32-bit size.

WDT_CNTR=0x4000_1A14																7	6	5	4	3	2	1	0								
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved																CNTR															
0x000000																0x00													WO		

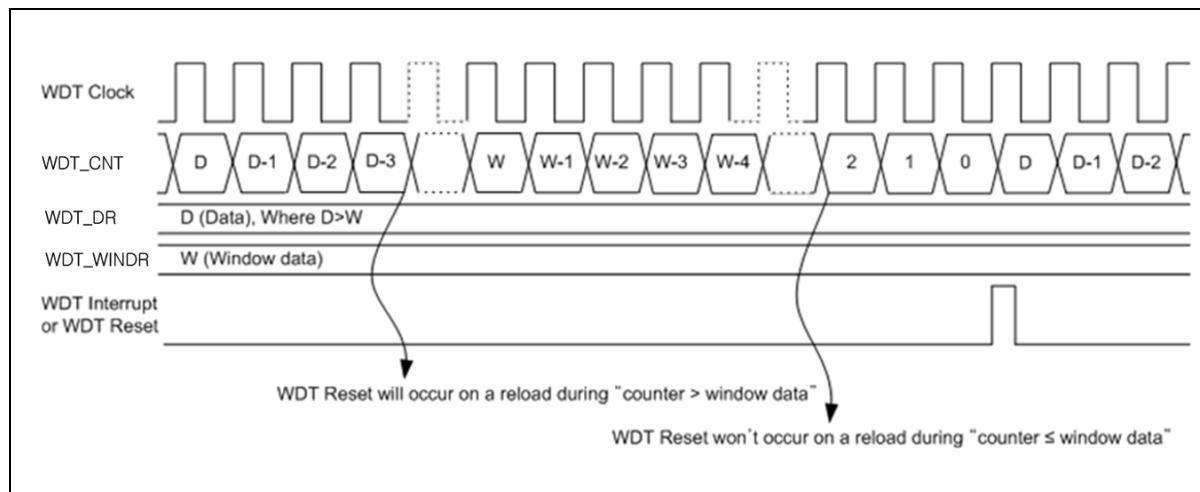

7	CNTR	Watchdog Timer Counter Reload bits.
0	0x6A	Reload the WDT_DR value to watchdog timer counter and re-start. (Automatically cleared to "0x00" after operation)
Others	No effect	

### 7.3 Functional description

Watchdog timer count can be enabled by CNTEN (WDT\_CR[9:4]) set as any value other than 0x1A. As the WDT activates, the down counter will start counting from the load value. If the RSTEN (WDT\_CR[15:10]) is set as any value other than 0x25, WDT reset would be asserted when the WDT counter value reaches 0 (underflow event) from WDT\_DR value.

Before WDT counter reaches 0, software can write 0x6A to WDT\_CNTR register in order to reload WDT counter when the counter value is less than or equal to the value of window data register. WDT reset may be asserted if the reload occurs when counter > window data.

#### 7.3.1 Timing diagram

**Figure 33. WDT Interrupt and WDT Reset Timing Diagram**

#### 7.3.2 Pre-scale table

The WDT includes a 24-bit down counter with programmable pre-scaler to define different time-out intervals.

Clock sources of the WDT can be WDTRC or PCLK. The PCLK can be selected by setting WDTCLK (SCU\_PPCLKSR[0]) to '1'. Then CONF\_WDTCNFIG[2] bit of configure option page 1 is cleared to logic '0'.

A WDT counter can be set as a base clock by controlling a 2-bit pre-scaler CLKDIV [1:0] in the WDT\_CR register. The maximum pre-scaled value is "clock source frequency/256". The pre-scaled WDT counter clock frequency values are listed in Table 32.

**Selectable clock source (40kHz ~ 40MHz) and time-out interval at a single count**

**Time-out period = (Load Value + 1) \* (1/pre-scaled WDT counter clock frequency)**

\*Time out period (when the Load Value reaches 0, underflow flag is set to '1')

**Table 32. Pre-scaled WDT Counter Clock Frequency**

Clock source	WDTCLKIN	WDTCLKIN/4	WDTCLKIN/16	WDTCLKIN/64	WDTCLKIN/256
WDTRC	40kHz	10kHz	2.5kHz	0.625kHz	0.156kHz
PCLK	PCLK	PCLK/4	PCLK/16	PCLK/64	PCLK/256

## 8 WATCH TIMER

WT (WATCH TIMER) has a function for RTC (Real Time Clock) operation. It is generally used for RTC design. The internal structure of the watch timer consists of the clock source select circuit, timer counter circuit, output select circuit and watch timer control register. To operate the watch timer, determine the input clock source, output interval and set WTEN as '1' in watch timer control register (WT\_CR). It is able to operate simultaneously or individually. To stop the WT, clear the WTEN bit in the WT\_CR register. Even when the CPU is in STOP mode, sub clock stays alive and the WT can continue operation. The WT\_CR can control WT clear and set Interval value at writing, and can read 12-bit WT counter value at reading. The WT features the followings:

- 14-bit Divider
- 12-bit up-counter
- RTC function

### 8.1 WT block diagram

Figure 34 shows a block diagram of the WT block.

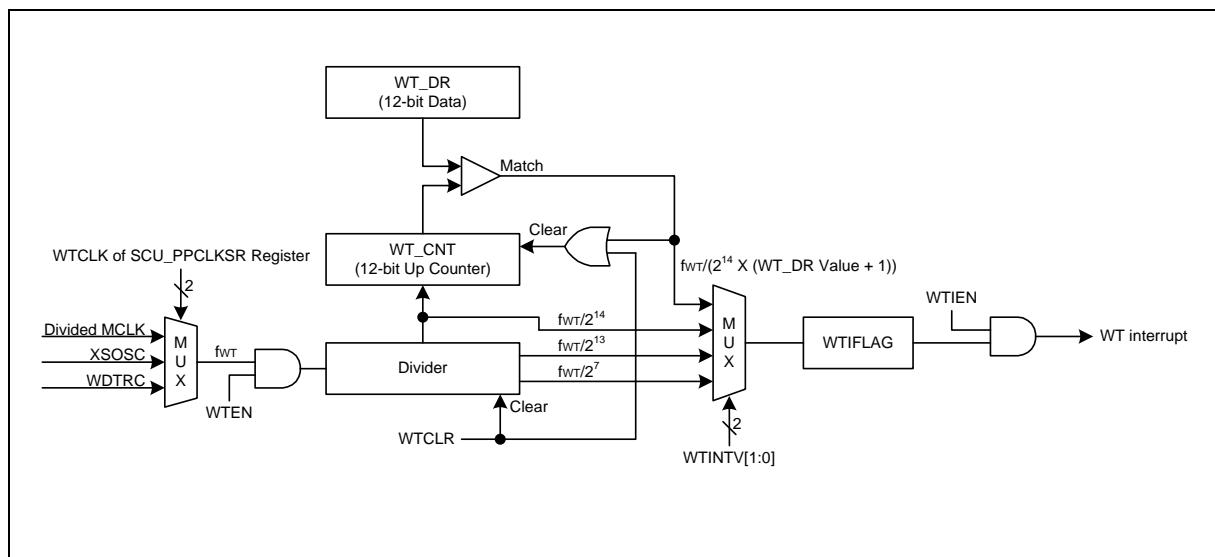

Figure 34. WT Block Diagram

## 8.2 Registers

Base address and register map of the WT are shown in Table 33 and Table 34.

## 9 Timer counter 10/11/12/13/14/15/16

The timer block comprises 7 channels of 16-bit general purpose timers. Each has an independent 16-bit counter and a dedicated prescaler that feeds counting clock. They support periodic timer, PWM pulse, one-shot and capture mode.

One more optional free-run timer is provided. The main purpose of this timer is a periodical tick timer or a wake-up source. The timer counter 10/11/12/13/14/15/16 features the followings:

- 16-bit up-counter and 12-bit prescaler
- Periodic timer, One-shot timer, PWM pulse, and Capture mode
- Synchronous start and clear function

## 9.1 Timer counter 10/11/12/13/14/15/16 block diagram

Figure 35 shows the block diagram of a timer block unit.

## 9.4 Functional description

### 9.4.1 Timer counter 10/11/12/13/14/15/16

Timer/counter n can use an internal or an external clock source (ECn). A clock selection logic can select a clock source and it is controlled by clock selection bits (TnCLK).

- Timer n clock source: {PCLK/(TIMERn\_PREDR+1)}, ECn

In Capture mode, by TnCAP, data is captured into a corresponding capture data register (TIMERn\_CAPDR). Timer n outputs the comparison result between counter and data register through TnOUT port in Timer/counter mode. Also, timer n output PWM waveform through TnOUT port under PPG mode. (n = 10, 11, 12, 13, 14, 15 and 16)

**Table 38. Timer n Operating Modes (n = 10, 11, 12, 13, 14, 15 and 16)**

TnEN	Alternative Mode	TnMS	TIMERn_PREDR	Timer n
1	TIMER10: PE_AFSR1[27:24] = 0x1 TIMER11: PE_AFSR1[31:28] = 0x1 TIMER12: PA_AFSR1[23:20] = 0x1 TIMER13: PF_AFSR2[11:8] = 0x1 TIMER14: PF_AFSR2[15:12] = 0x1 TIMER15: PB_AFSR2[15:12] = 0x1 TIMER16: PB_AFSR2[11:8] = 0x1	00	0xXXX	Timer/Counter Mode
1	TIMER10: PE_AFSR1[27:24] = 0x2 TIMER11: PE_AFSR1[31:28] = 0x2 TIMER12: PA_AFSR1[23:20] = 0x2 TIMER13: PF_AFSR2[11:8] = 0x2 TIMER14: PF_AFSR2[15:12] = 0x2 TIMER15: PB_AFSR2[15:12] = 0x2 TIMER16: PB_AFSR2[11:8] = 0x2	01	0xXXX	Capture Mode
1	TIMER10: PE_AFSR1[27:24] = 0x1 TIMER11: PE_AFSR1[31:28] = 0x1	10	0xXXX	PPG Mode (one-shot mode)
1	TIMER12: PA_AFSR1[23:20] = 0x1 TIMER13: PF_AFSR2[11:8] = 0x1 TIMER14: PF_AFSR2[15:12] = 0x1 TIMER15: PB_AFSR2[15:12] = 0x1 TIMER16: PB_AFSR2[11:8] = 0x1	11	0xXXX	PPG Mode (repeat mode)

#### 9.4.2 16-bit Timer/counter mode

16-bit Timer/counter mode is selected by control register as shown in Figure 36. The 16-bit timer has a counter register and a data register. The counter register is increased by internal or external clock input. Timer n can use an input clock with 12-bit prescaler division rates (TIMERn\_PREDR) and an external clock (ECn). When the values of TIMERn\_CNT and TIMERn\_ADR are the same in the timer n, a match signal is generated and the interrupt of Timer n takes place.

The TIMERn\_CNT values are automatically cleared by the match signal. It can also be cleared by software (TnCLR).

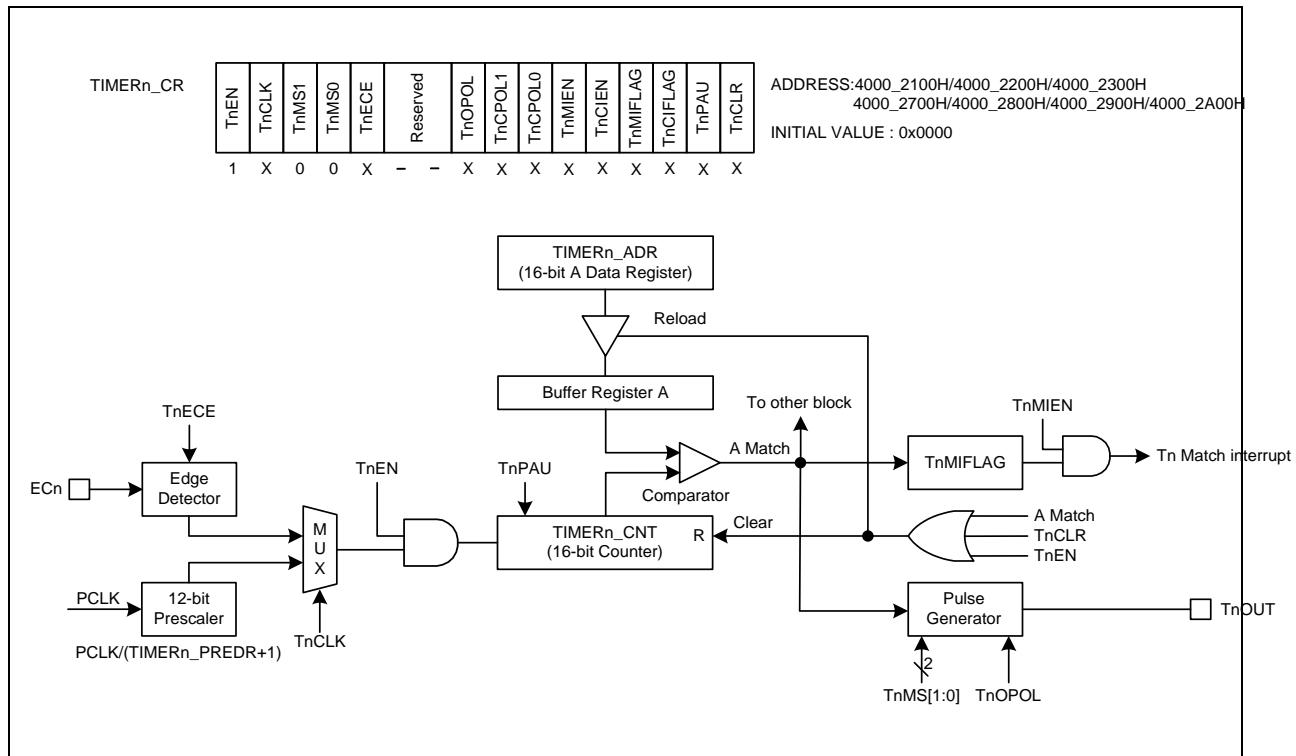

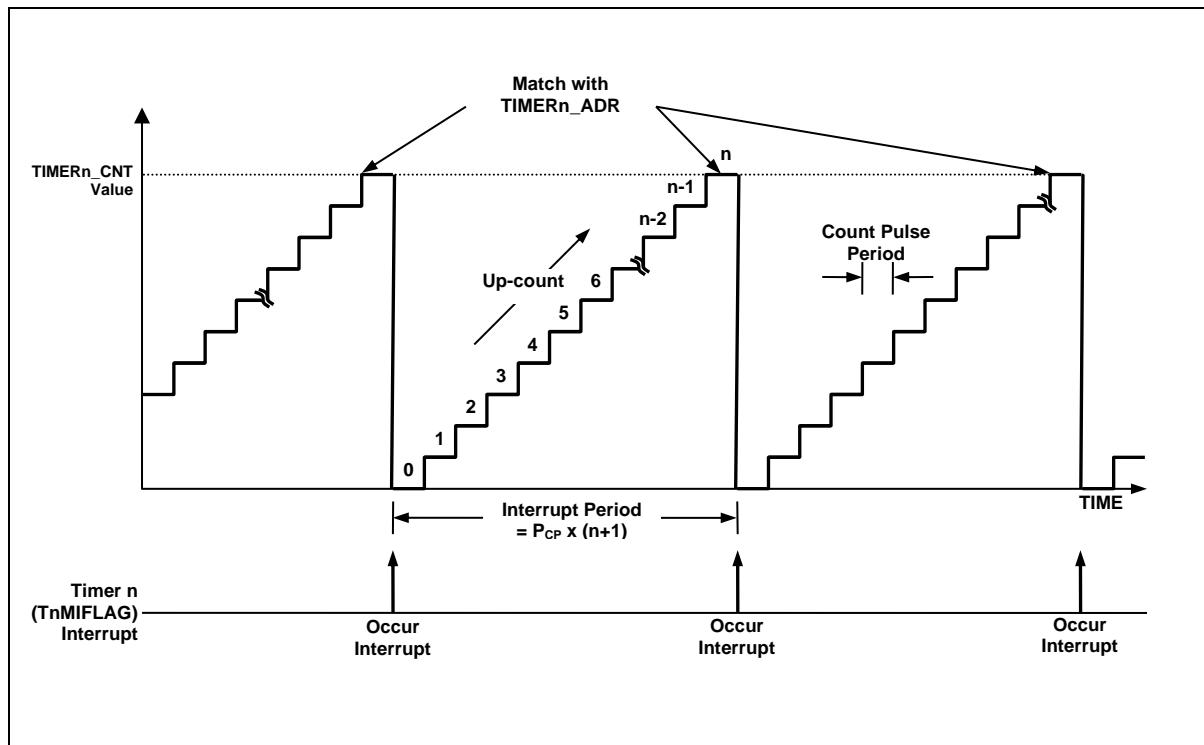

Figure 36. 16-bit Timer/Counter Mode for Timer n (n = 10, 11, 12, 13, 14, 15 and 16)

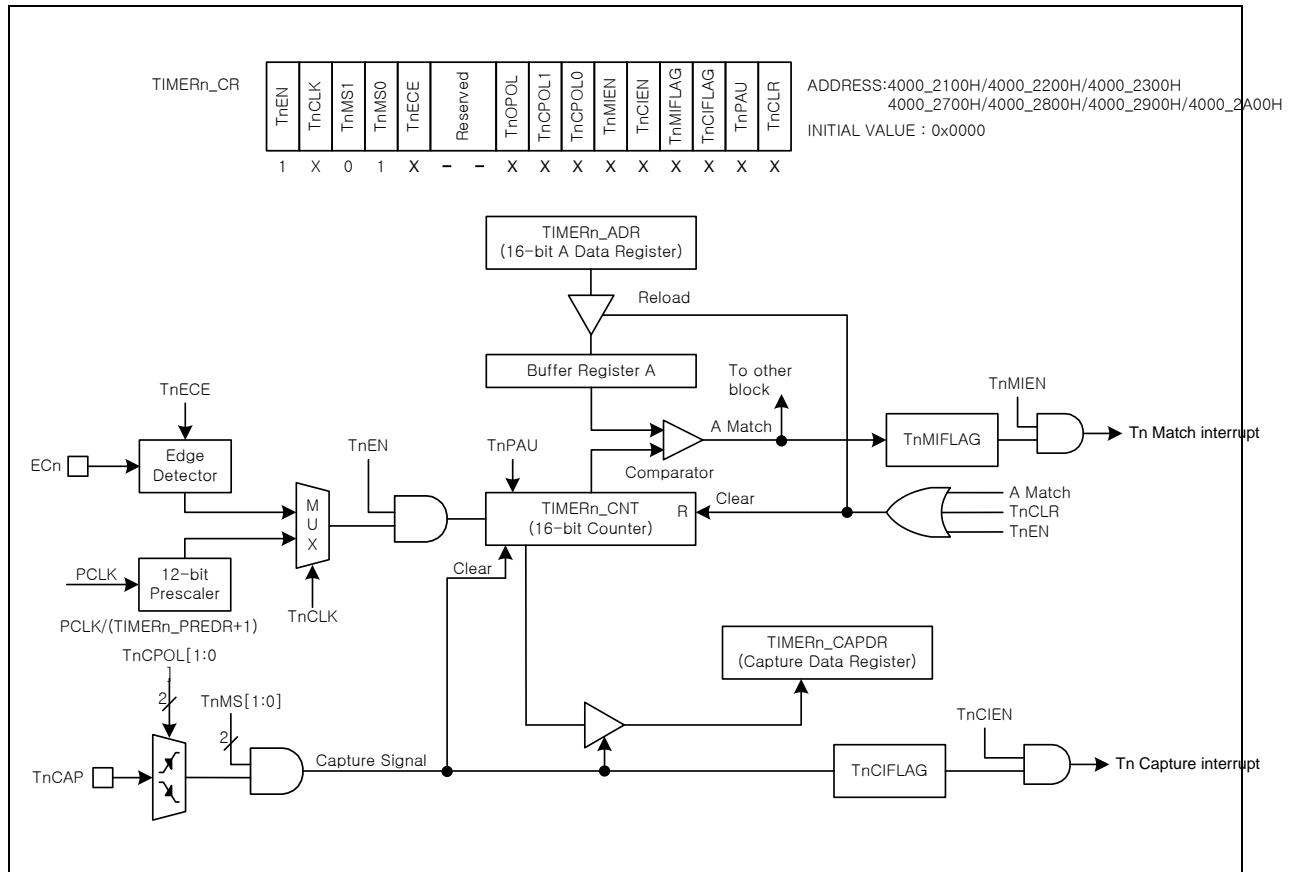

**Figure 37. 16-bit Timer/Counter n Example (n = 10, 11, 12, 13, 14, 15 and 16)**

### 9.4.3 16-bit Capture mode

Timer n Capture mode is evoked by configuring TnMS[1:0] as '01'. The internal clock can be used as a clock source. It basically has the same function as the 16-bit timer/counter mode and an interrupt takes place when TIMERn\_CNT becomes equal to TIMERn\_ADR.

This timer interrupt in Capture mode is very useful when the pulse width of captured signal is wider than the maximum period of timer. The capture result is loaded into TIMERn\_CAPDR. In the timer n capture mode, timer n output (TnOUT) waveform is not available.

**Figure 38. 16-bit Capture Mode for Timer n (n = 10, 11, 12, 13, 14, 15 and 16)**

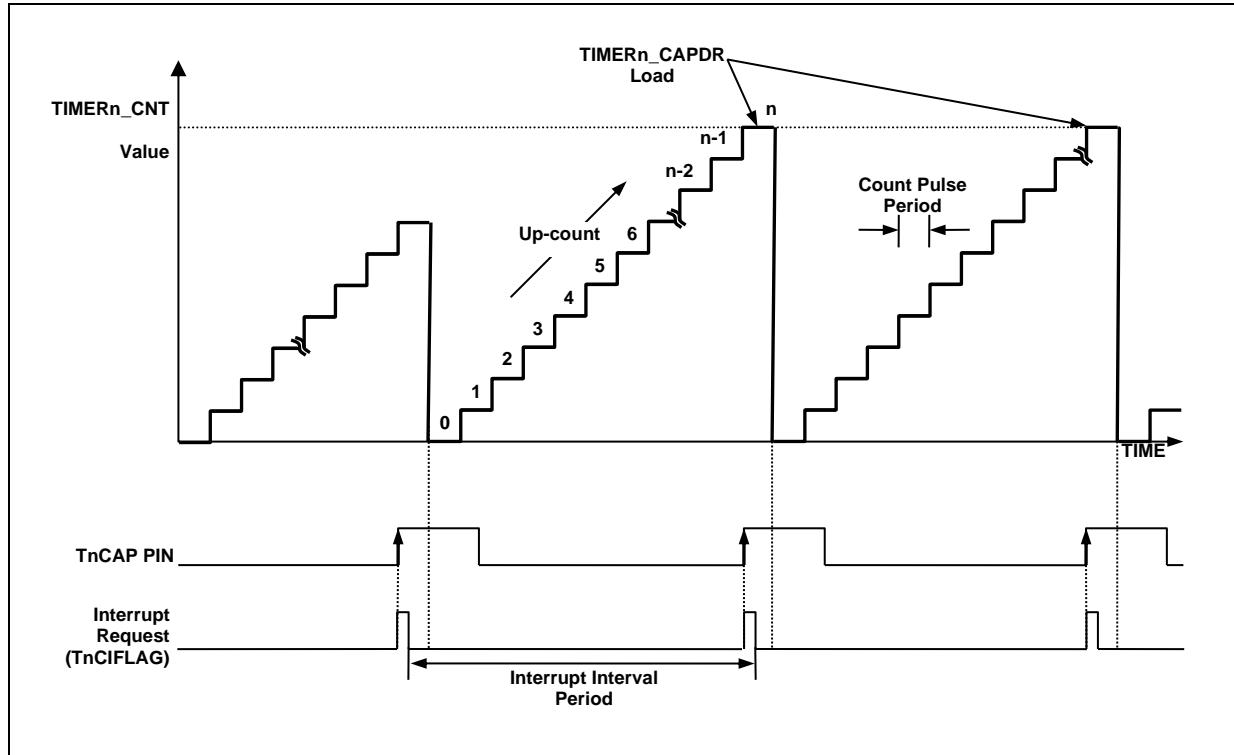

Figure 39. 16-bit Capture Mode for Timer n (n = 10, 11, 12, 13, 14, 15 and 16)

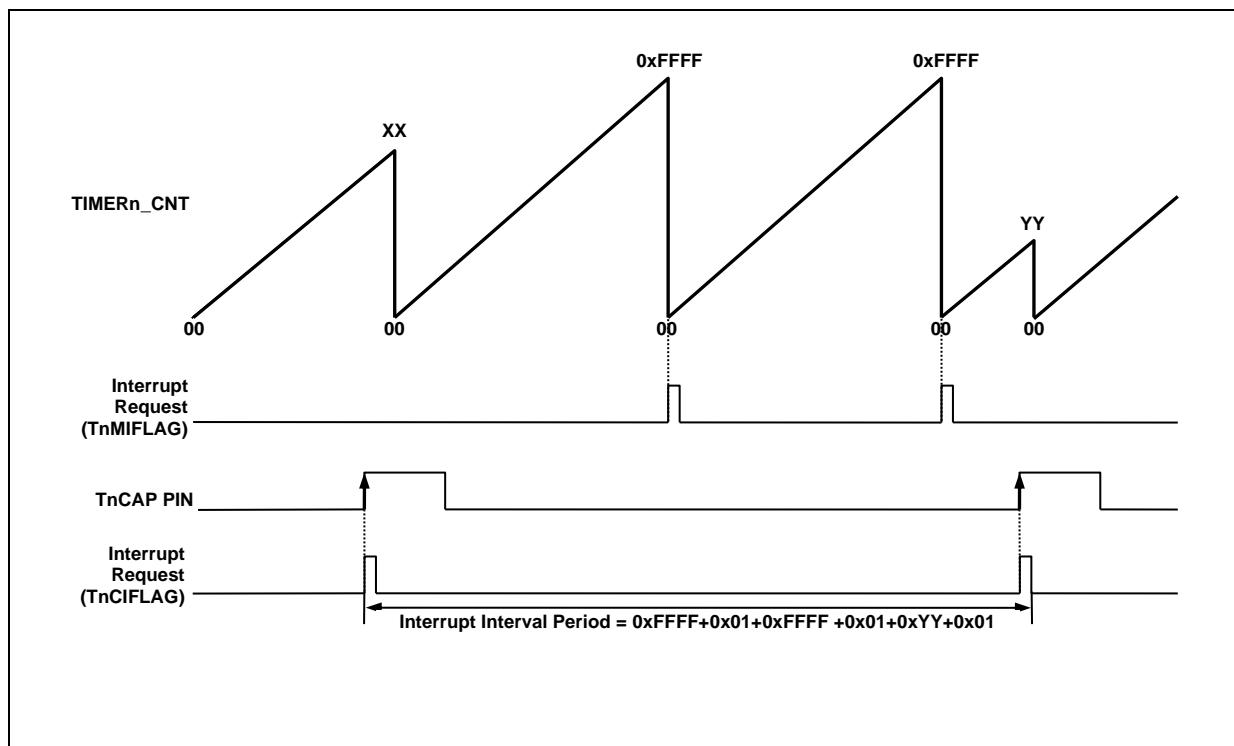

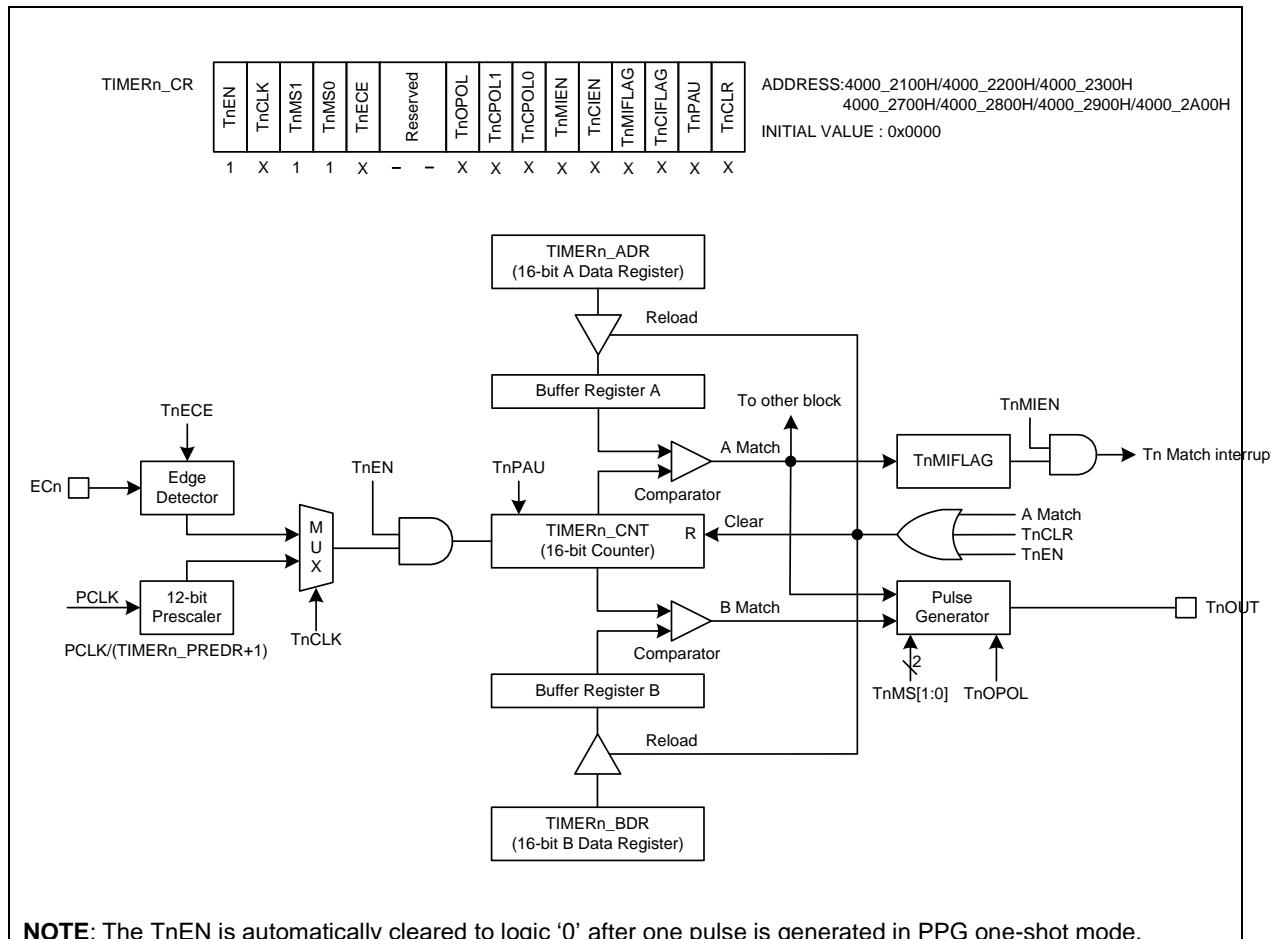

Figure 40. Express Timer Overflow in Capture Mode (n = 10, 11, 12, 13, 14, 15 and 16)

#### 9.4.4 16-bit PPG mode

Timer n has a PPG (Programmable Pulse Generation) function. In PPG mode, the TnOUT pin generates PWM output of up to 16-bit resolution. This pin should be configured as a PWM output by setting Px\_AFSR1, Px\_AFSR2 to 'AF1'. The period of PWM output is determined by the TIMERn\_ADR. The duty of PWM output is determined by TIMERn\_BDR. (x = A to F)

**NOTE:** The TnEN is automatically cleared to logic '0' after one pulse is generated in PPG one-shot mode.

Figure 41. 16-bit PPG Repeat and One-shot Mode for Timer n (n = 10, 11, 12, 13, 14, 15 and 16)

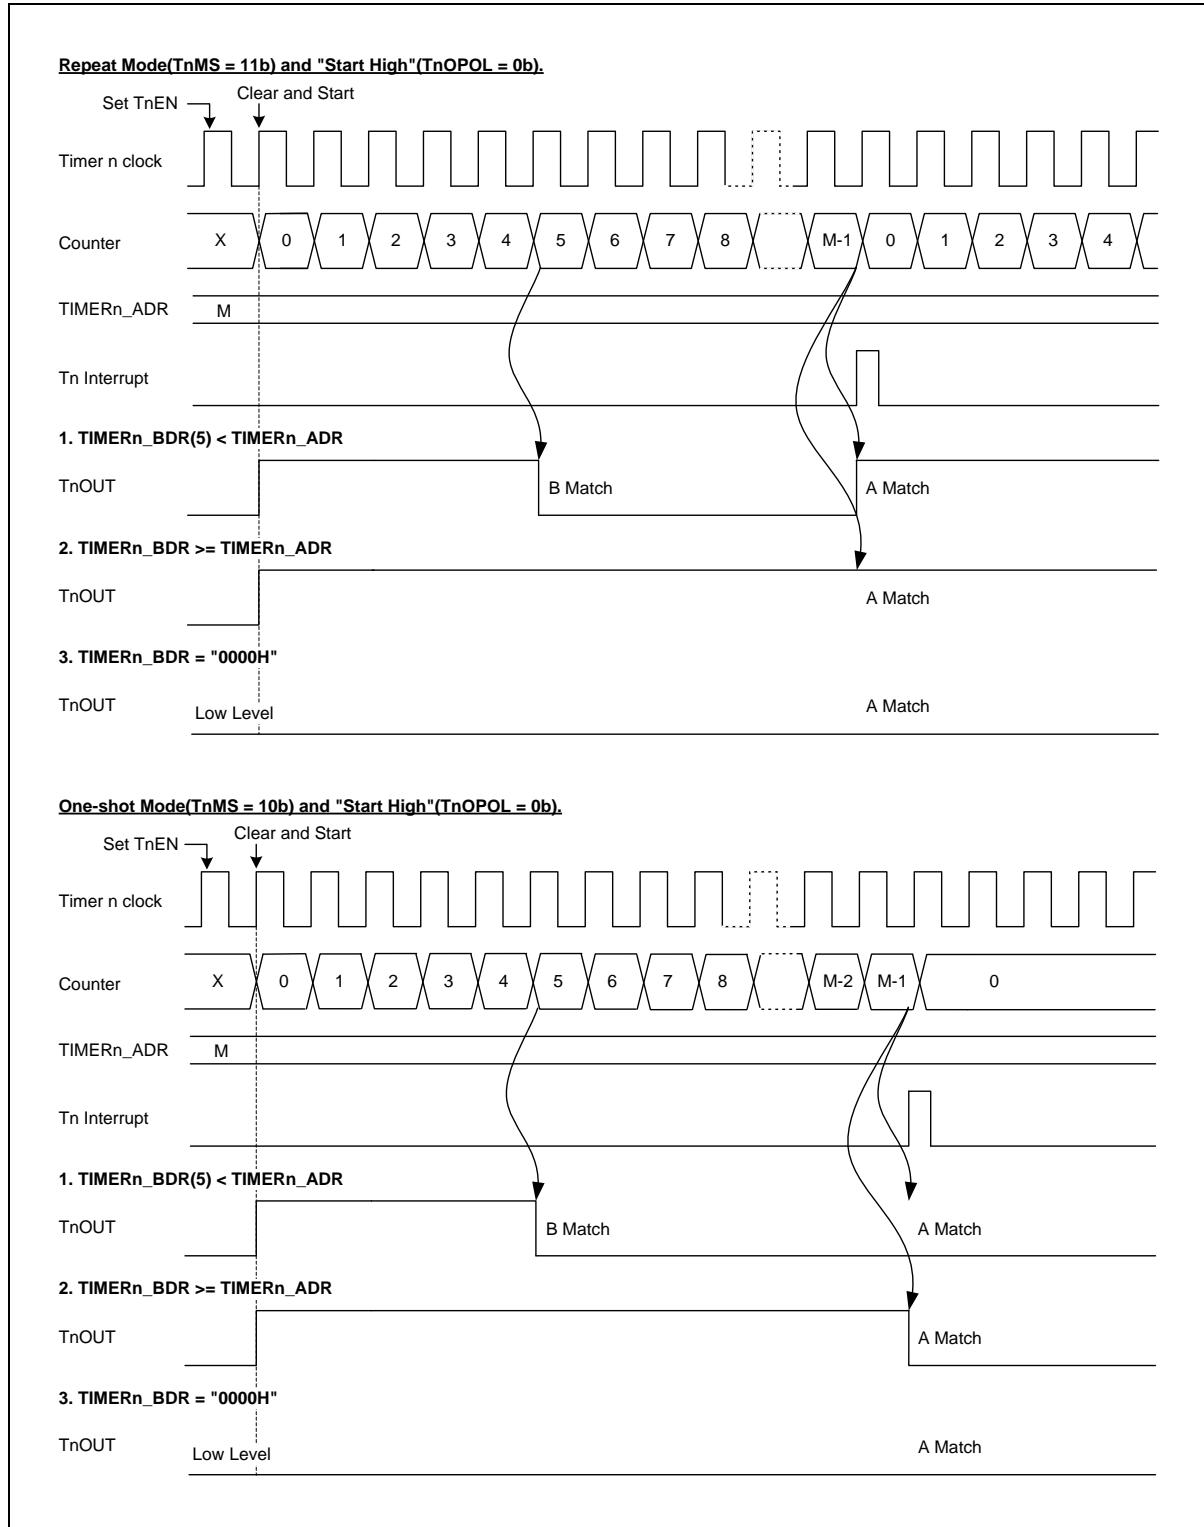

Figure 42. 16-bit PPG Mode Timing chart for Timer n (n = 10, 11, 12, 13, 14, 15 and 16)

## 10 Timer counter 20

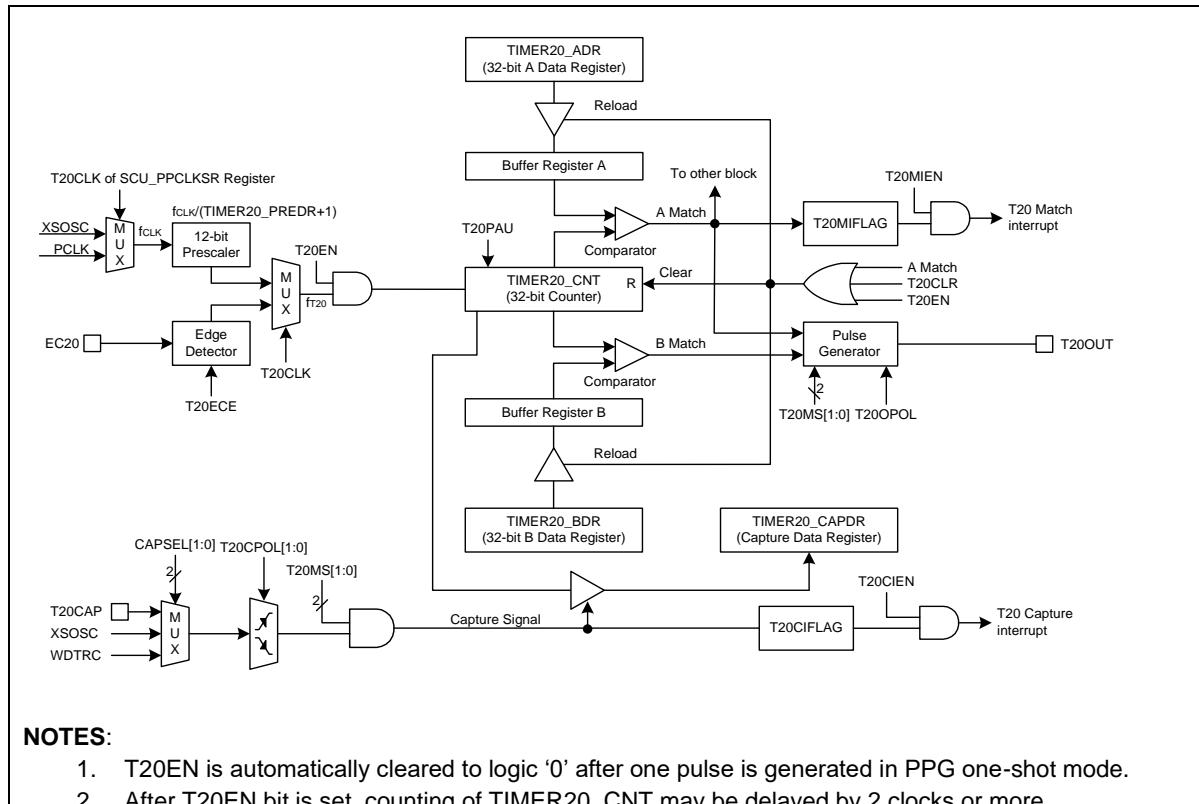

A timer block comprises a single channel 32-bit general purpose timer. This timer has an independent 32-bit counter and a dedicated prescaler that feeds counting clock. It supports periodic timer, PWM pulse, one-shot timer and capture mode.

One more optional free-run timer is provided. Main purpose of this timer is a periodical tick timer or a wake-up source. The Timer counter 20 features the followings:

- 32-bit up-counter and 12-bit prescaler
- Periodic timer, One-shot timer, PWM pulse, and Capture mode
- Synchronous start and clear function

## 10.1 Timer counter 20 block diagram

Figure 43 shows the block diagram of a timer block unit.

### NOTES:

1. T20EN is automatically cleared to logic '0' after one pulse is generated in PPG one-shot mode.
2. After T20EN bit is set, counting of TIMER20\_CNT may be delayed by 2 clocks or more.

**Figure 43. Timer Counter 20 Block Diagram**

## 10.4 Functional description

### 10.4.1 Timer counter 20

Timer/counter 20 can use an internal or an external clock as a clock source (EC20). A clock selection logic selects the clock source and the clock selection logic is controlled by clock selection bits (T20CLK).

- TIMER 20 clock sources are listed as followings:
  - PCLK/(TIMER20\_PREDR +1)
  - XSOSC/(TIMER20\_PREDR +1)
  - EC20

In capture mode, by T20CAP, XSOSC or WDTRC data is captured into input capture data register (TIMER20\_CAPDR). Timer 20 outputs the comparison result between counter and data register through T20OUT port in Timer/counter mode. In addition, Timer 20 outputs PWM waveform through T20OUT port in PPG mode.

**Table 42. Timer 20 Operating Modes**

T20EN	Alternative mode	T20MS[1:0]	TIMER20_PREDR	Timer 20
1	PC_AFSR1[3:0] = 0x1	00	0xXXX	32-bit Timer/Counter Mode
1	PC_AFSR1[3:0] = 0x2	01	0xXXX	32-bit Capture Mode
1	PC_AFSR1[3:0] = 0x1	10	0xXXX	32-bit PPG Mode(one-shot mode)
1	PC_AFSR1[3:0] = 0x1	11	0xXXX	32-bit PPG Mode(repeat mode)

### 10.4.2 32-bit Timer/counter mode

32-bit Timer/counter mode is selected by control register as shown in Figure 44. The 32-bit timer has a counter register and a data register. The counter register is increased by internal or external clock input. Timer 20 can use an input clock with 12-bit prescaler division rates (TIMER20\_PREDR) and an external Clock (EC20). When the values of TIMER20\_CNT and TIMER20\_ADR are the same in the timer 20, a match signal is generated and the interrupt of Timer 20 takes place. The TIMER20\_CNT values are automatically cleared by match signal. It can also be cleared by software (T20CLR).

The TIMER20\_CNT values are automatically cleared by match signal. It can also be cleared by software (T20CLR).

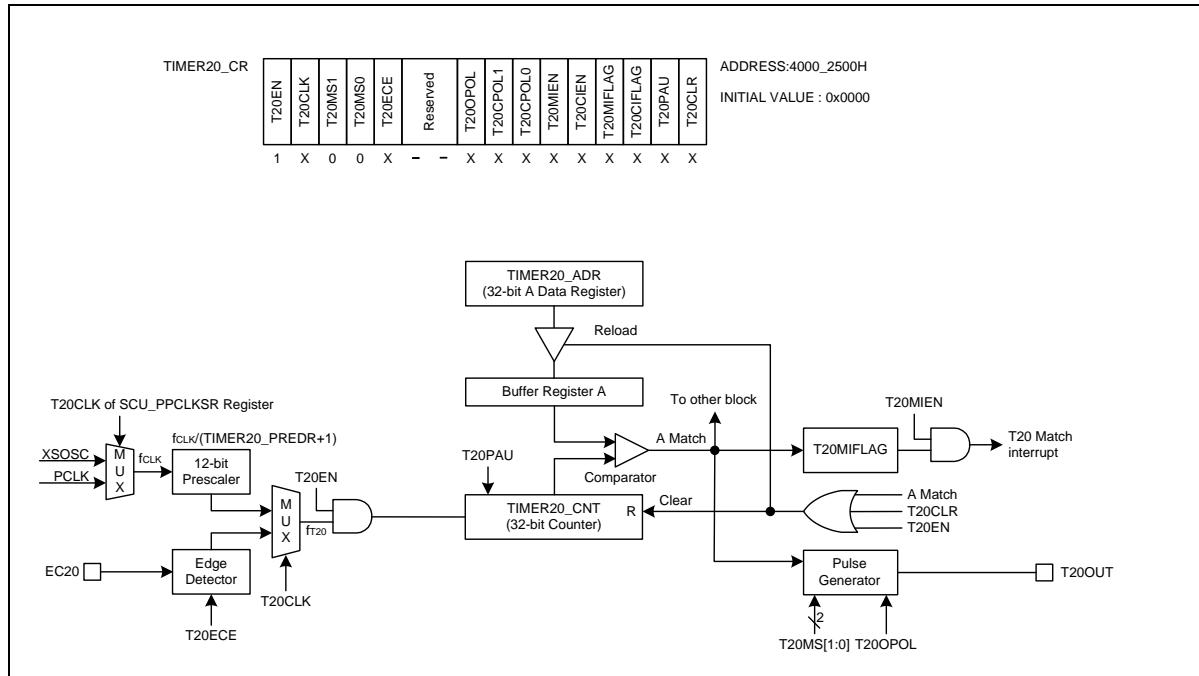

Figure 44. 32-bit Timer/Counter Mode for Timer 20

## 11.4 Functional description

### 11.4.1 Timer counter 21

Timer/counter 21 can use an internal or an external clock as a clock source (EC21). A clock selection logic selects the clock source and the clock selection logic is controlled by clock selection bits (T21CLK).

- TIMER 21 clock sources are listed as followings:
  - PCLK/(TIMER21\_PREDR +1)
  - EC21

In capture mode, by T21CAP, data is captured into input capture data register (TIMER21\_CAPDR). Timer 21 outputs the comparison result between counter and data register through T21OUT port in Timer/counter mode. In addition, Timer 21 outputs PWM waveform through T21OUT port in PPG mode.

**Table 46. Timer 21 Operating Modes**

T21EN	Alternative mode	T21MS[1:0]	TIMER21_PREDR	Timer 21
1	PC_AFSR1[7:4] = 0x1	00	0xXXX	32-bit Timer/Counter Mode
1	PC_AFSR1[7:4] = 0x2	01	0xXXX	32-bit Capture Mode
1	PC_AFSR1[7:4] = 0x1	10	0xXXX	32-bit PPG Mode(one-shot mode)
1	PC_AFSR1[7:4] = 0x1	11	0xXXX	32-bit PPG Mode(repeat mode)

### 11.4.2 32-bit Timer/counter mode

32-bit Timer/counter mode is selected by control register as shown in Figure 52. The 32-bit timer has a counter register and a data register. The counter register is increased by internal or external clock input. Timer 21 can use an input clock with 12-bit prescaler division rates (TIMER21\_PREDR) and an external Clock (EC21). When the values of TIMER21\_CNT and TIMER21\_ADR are the same in the timer 21, a match signal is generated and the interrupt of Timer 21 takes place. The TIMER21\_CNT values are automatically cleared by match signal. It can also be cleared by software (T21CLR).

The TIMER21\_CNT values are automatically cleared by match signal. It can also be cleared by software (T21CLR).

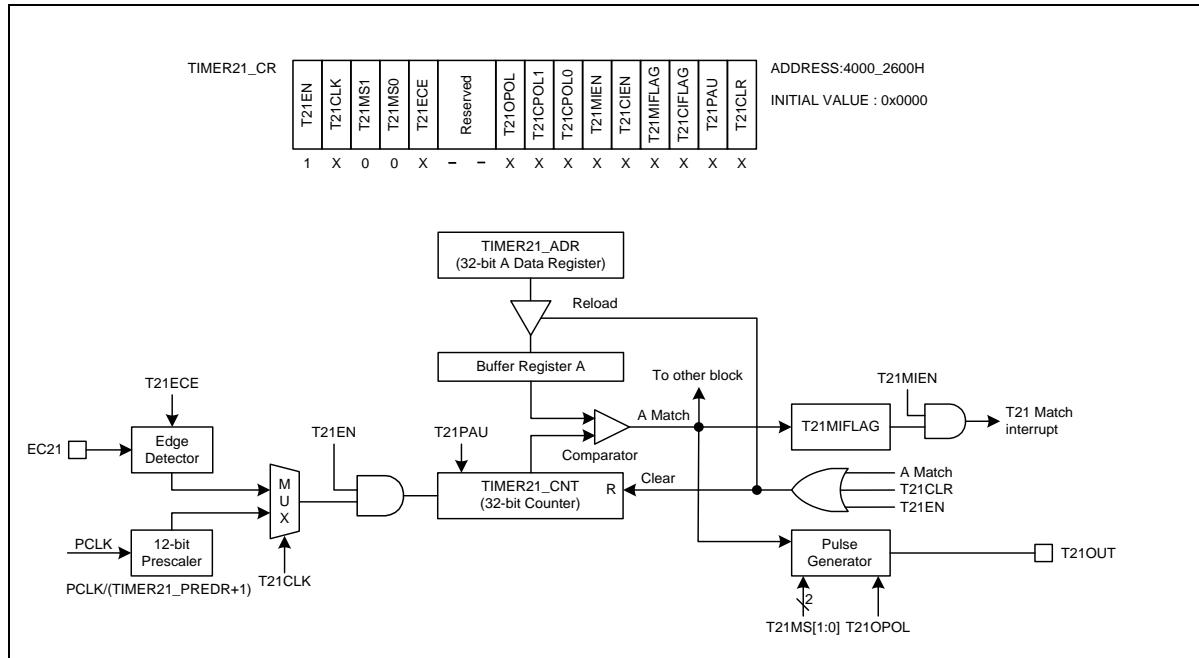

Figure 52. 32-bit Timer/Counter Mode for Timer 21

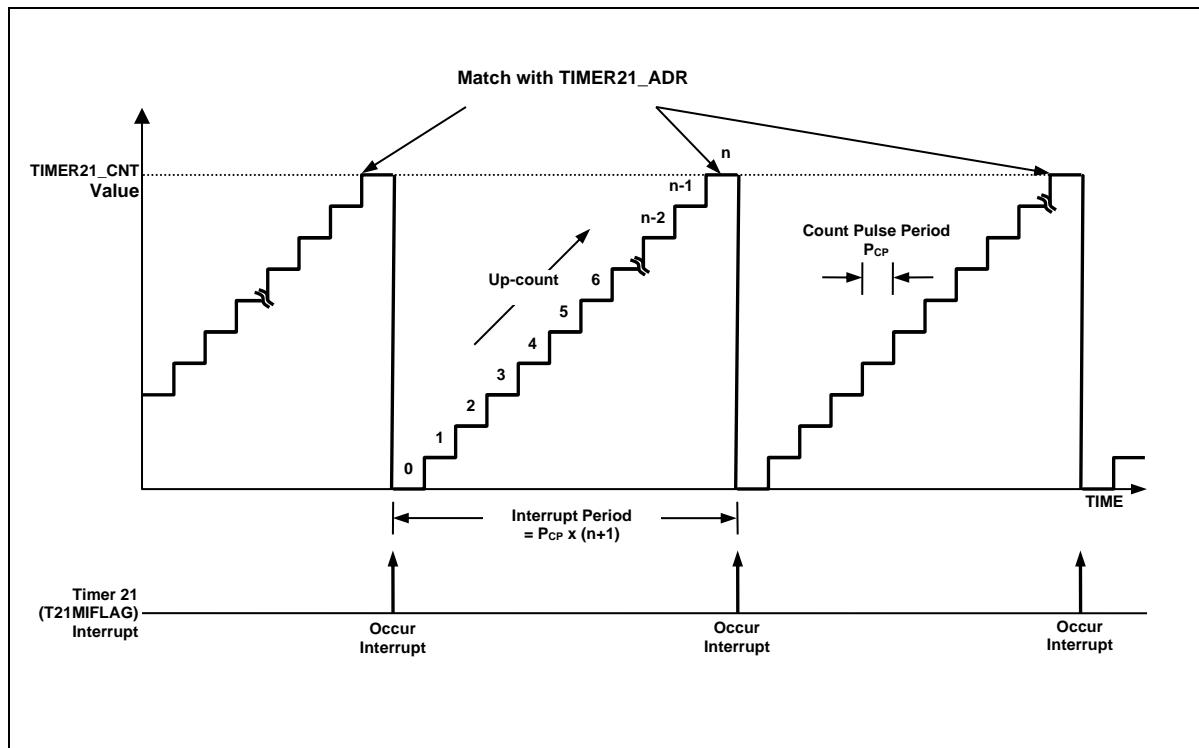

Figure 53. 32-bit Timer/Counter 21 Example

#### 11.4.3 32-bit Capture mode

Timer 21 Capture mode is evoked by configuring T21MS[1:0] as '01'. The internal clock can be used as a clock source. It basically has the same function as the 32-bit timer/counter mode and an interrupt takes place when TIMER21\_CNT becomes equal to TIMER21\_ADR. TIMER21\_CNT values are cleared by software (T21CLR).

This timer interrupt in Capture mode is very useful when the pulse width of captured signal is wider than the maximum period of timer. The capture result is loaded into TIMER21\_CAPDR. In the timer 21 capture mode, timer 21 output (T21OUT) waveform is not available.

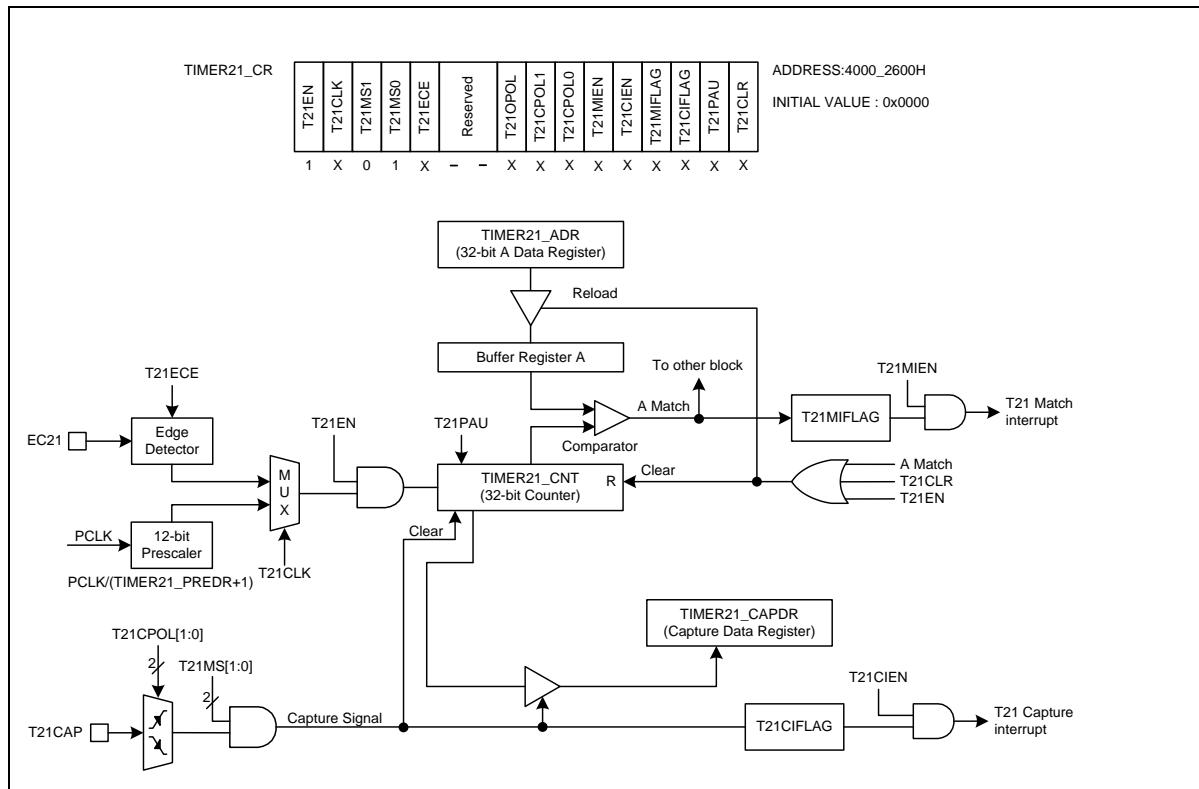

Figure 54. 32-bit Capture Mode for Timer 21

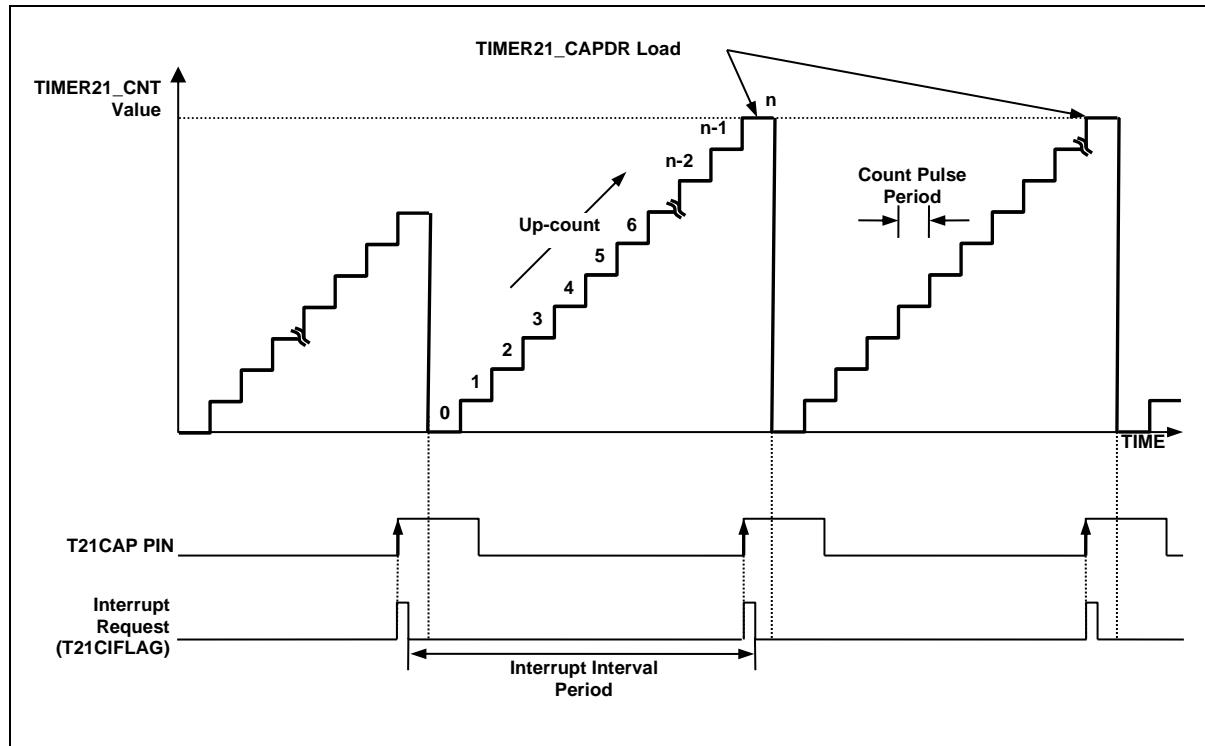

Figure 55. 32-bit Capture Mode for Timer 21

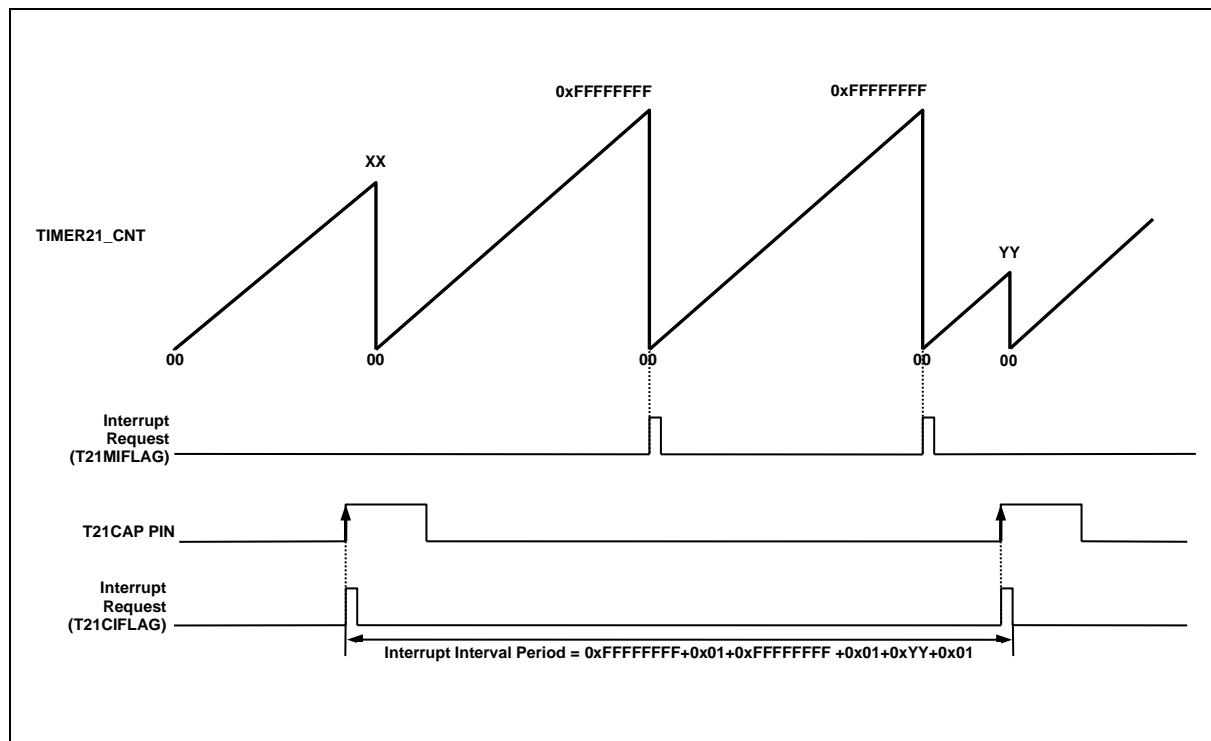

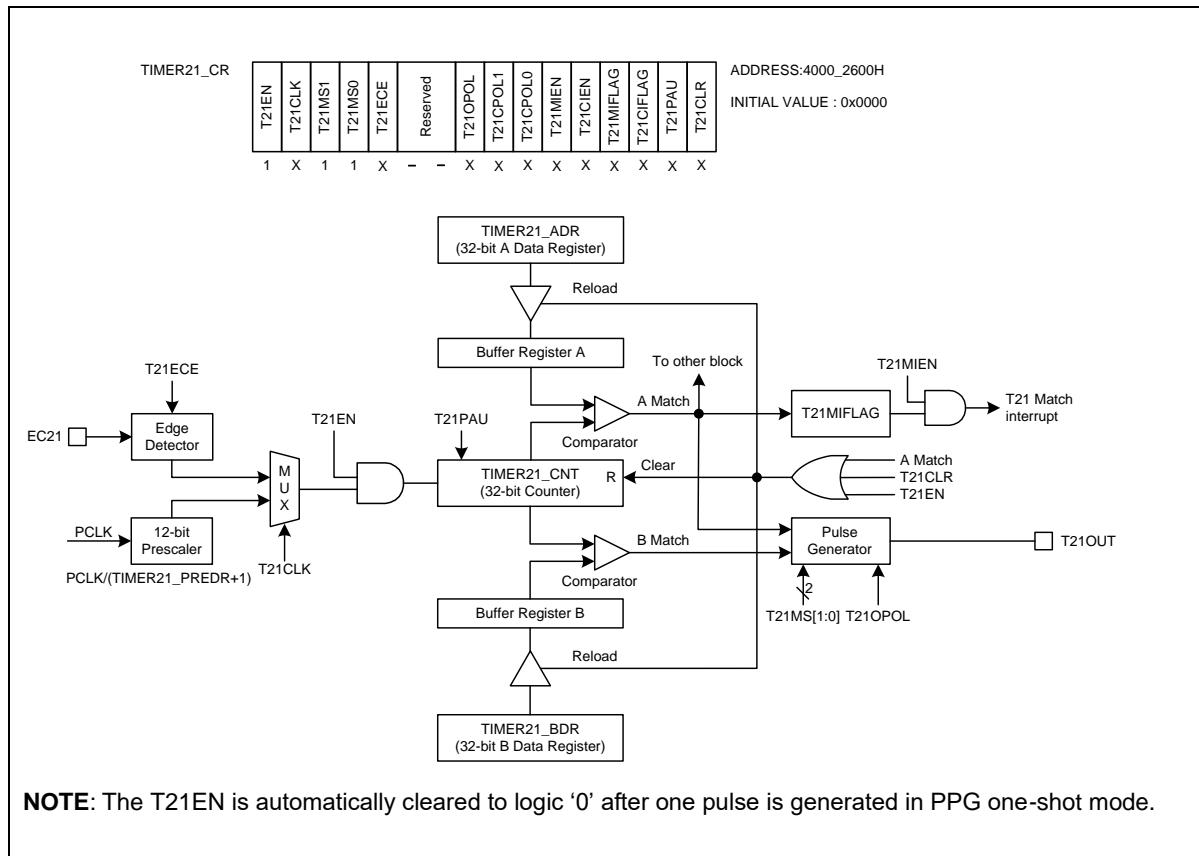

Figure 56. Express Timer Overflow in Capture Mode

#### 11.4.4 32-bit PPG mode

Timer 21 has a PPG (Programmable Pulse Generation) function. In PPG mode, the T21OUT pin generates PWM output of up to 32-bit resolution. This pin should be configured as a PWM output by setting PC\_AFSR1[7:4] to 'AF1'. The period of PWM output is determined by the TIMER21\_ADR. The duty of PWM output is determined by TIMER21\_BDR.

**Figure 57. 32-bit PPG Repeat and One-shot Mode for Timer 21**

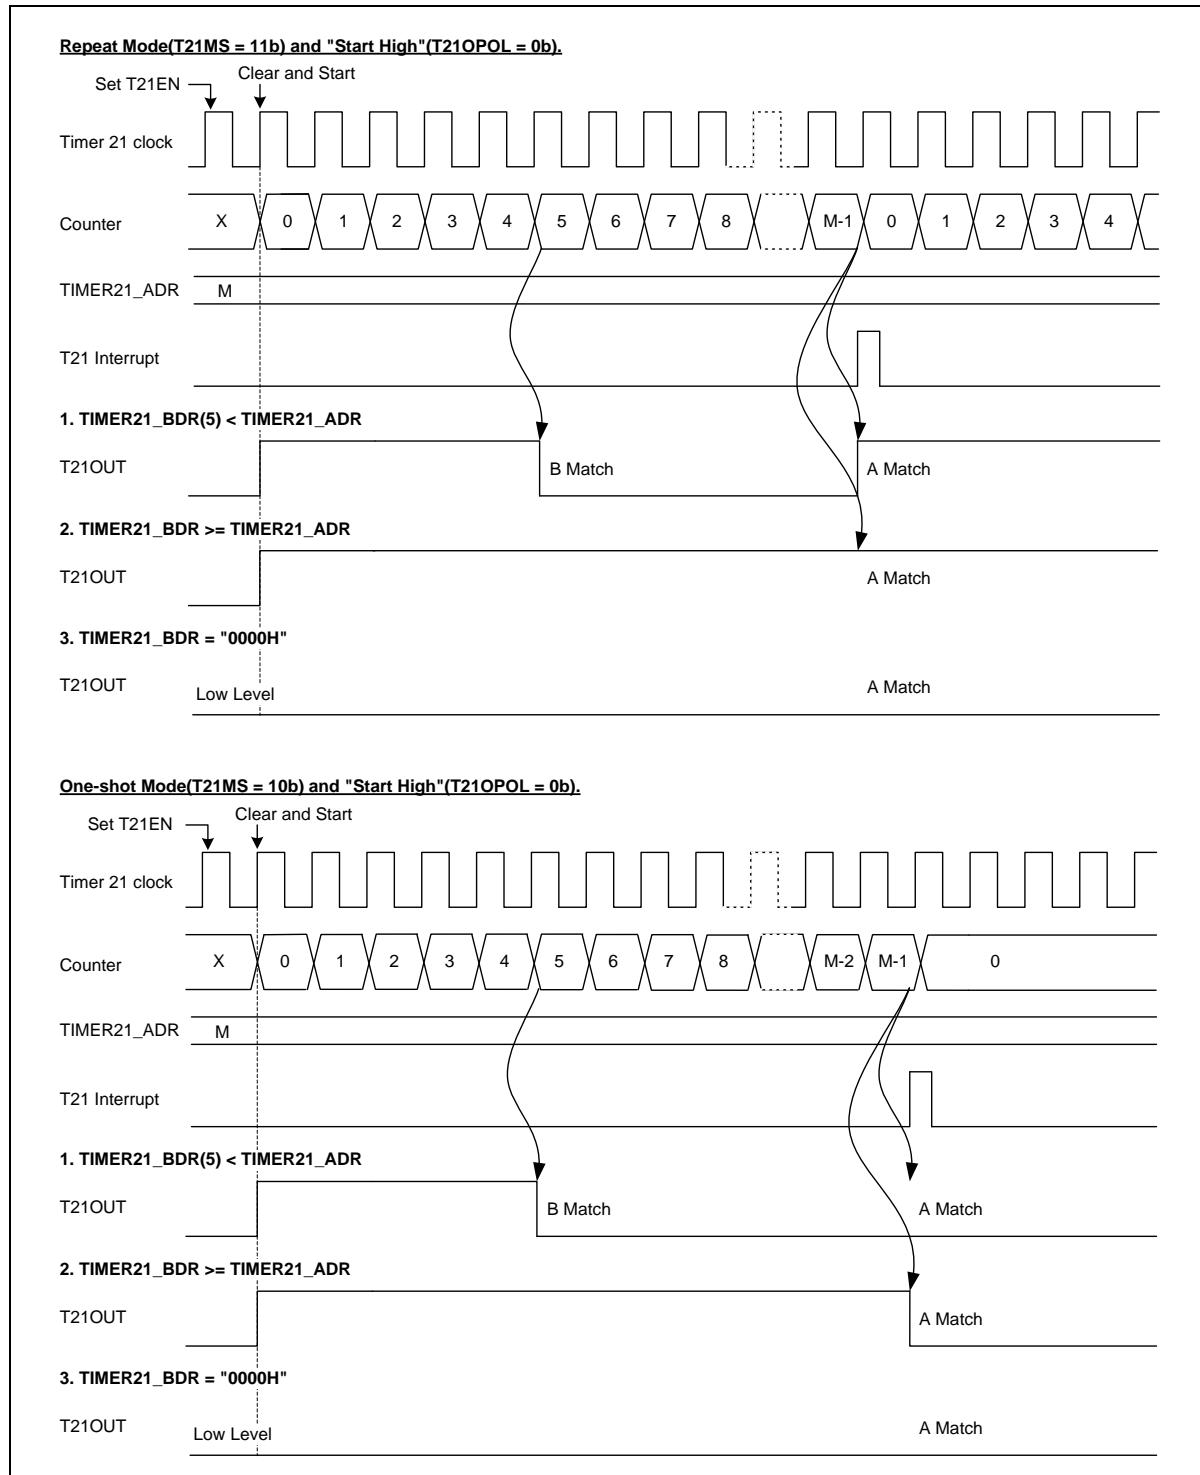

Figure 58. 32-bit PPG Mode Timing chart for Timer 21

## 12 Timer counter 30

A timer counter 30 is a 16-bit timer with 3-phase PWM function. It has ADC triggering feature for motor control.

The Timer counter 30 features the followings:

- 16-bit up/down-counter and 12-bit prescaler
- Periodic timer, Back-to-Back timer, and Capture mode

## 12.1 Timer counter 30 block diagram

Figure 59 shows the block diagram of a timer block unit.

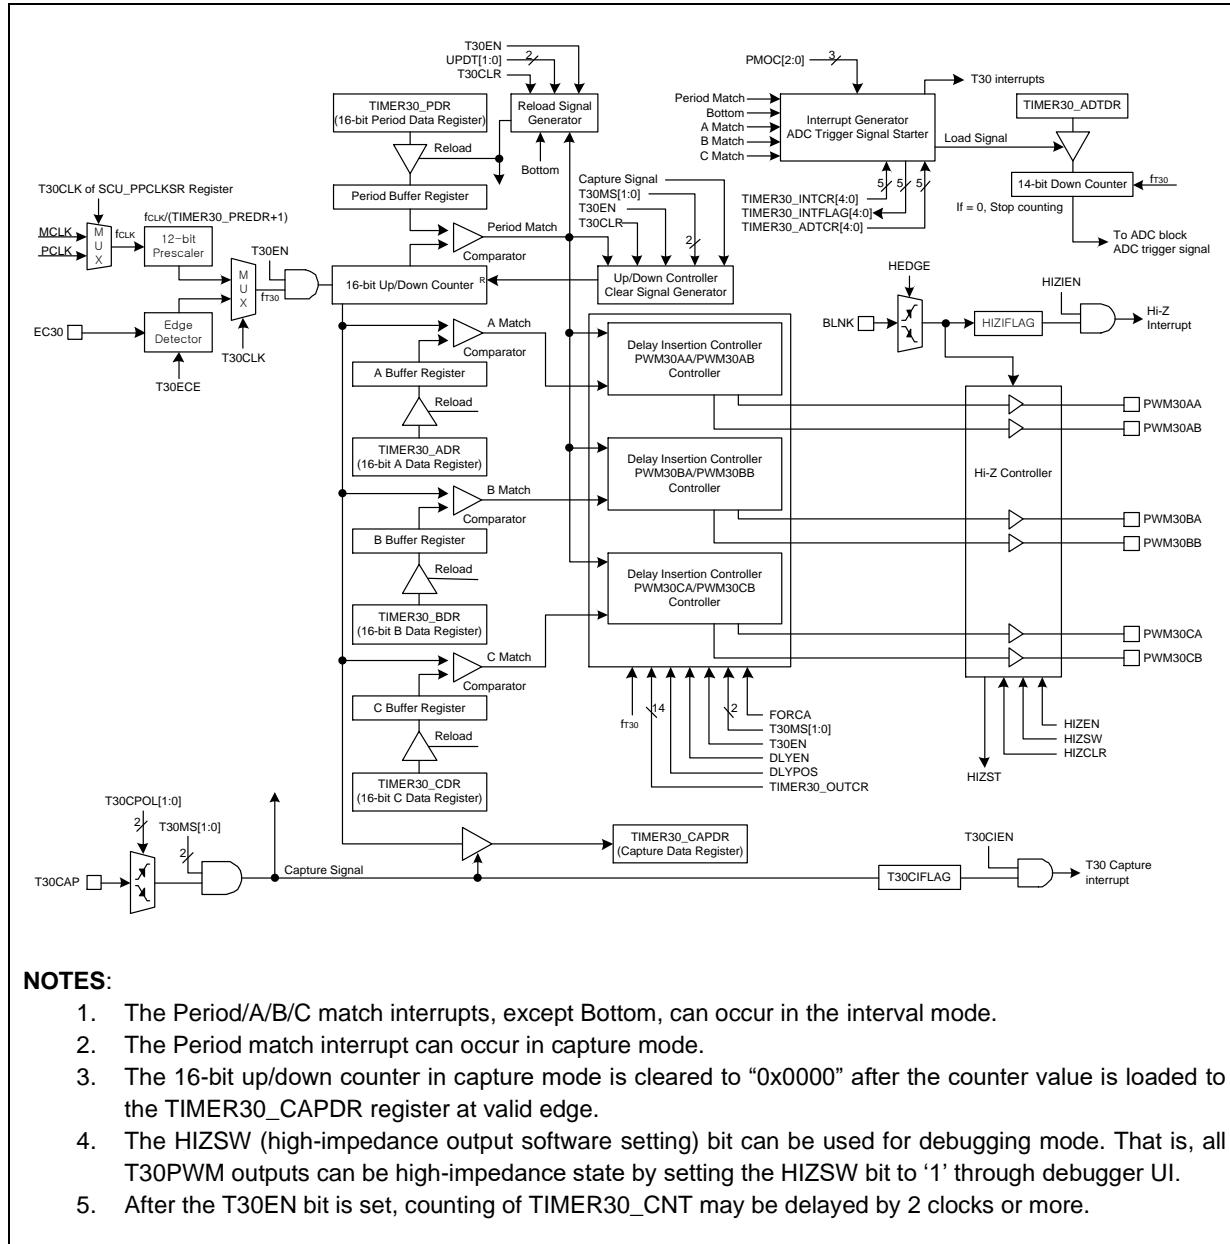

Figure 59. Timer Counter 30 Block Diagram

## 12.4 Functional description

### 12.4.1 Timer counter 30

Timer/counter 30 can use an internal or an external clock as a clock source (EC30). A clock selection logic selects the clock source and the clock selection logic is controlled by clock selection bits (T30CLK).

- TIMER 30 clock sources are listed as followings:
  - PCLK/(TIMER30\_PREDR +1)
  - MCLK/(TIMER30\_PREDR +1)
  - EC30

In capture mode, by T30CAP, data is captured into input capture data register (TIMER30\_CAPDR). The PWM waveform to PWM30AA, PWM30AB, PWM30BA, PWM30BB, PWM30CA, PWM3CB Port(6-channel).

**Table 50. Timer 30 Operating Modes**

T30EN	T30MS[1:0]	TIMER30_PREDR	Timer 30
1	00	0xXXX	16-bit Timer/Counter Mode
1	01	0xXXX	16-bit Capture Mode
1	10	0xXXX	16-bit back-to-back Mode

### 12.4.2 Timer 30 capture mode

16-bit timer 30 capture mode is set by T30MS[1:0] as '01'. The clock source can use the internal or external clock input. It basically has the same function as the 16-bit interval mode and an interrupt takes place when T30 16-bit up/down counter is equal to TIMER30\_PDR. The T30 16-bit up/down counter values are automatically cleared by match signal. It can also be cleared by software (T30CLR).

This timer interrupt in capture mode is very useful when the pulse width of captured signal is wider than the maximum period of timer.

The capture result is loaded into TIMER30\_CAPDR.

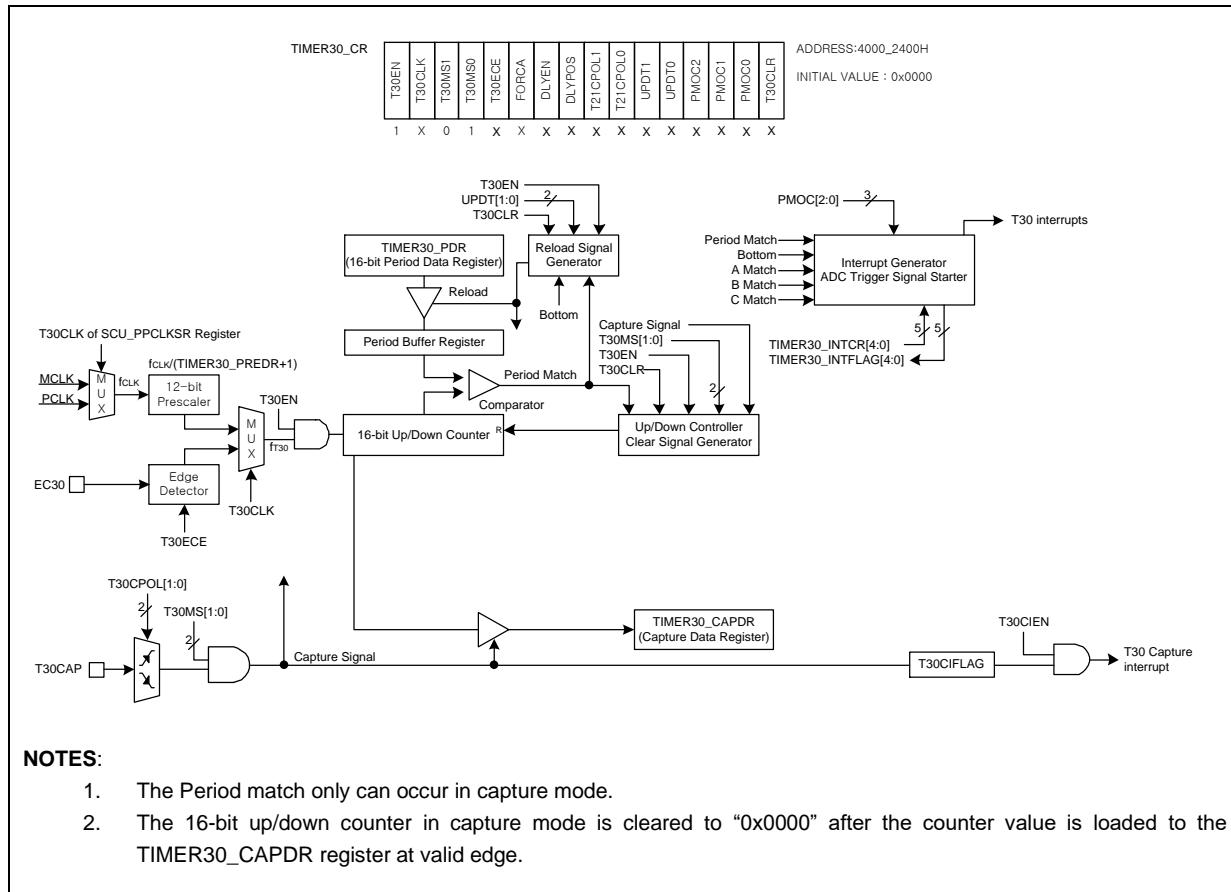

Figure 60. 16-bit Capture Mode for Timer 30

#### 12.4.3 Timer 30 interval mode

Interval mode is set by T30MS[1:0] as ‘00’. The timer 30 has a counter and a data register. The 16-bit up/down counter is increased by internal or external clock input. The timer 30 can use an input clock with 12-bit prescaler division rates (TIMER30\_PREDR[11:0]). When the value of T30 16-bit up/down counter and the value of TIMER30\_PDR are identical in timer 30, a match signal is generated and the period match interrupt of timer 30 is occurred. The period match interrupt can take place at every 1, 2, 3, 4, 5, 6, 7, or 8 period match (PMOC[2:0]). The 16-bit up/down counter value is automatically cleared by match signal. It can also be cleared by software (T30CLR).

The timer 30 Interval mode can be used for BLDC motor control. It has 6-channel pins that generate PWM outputs up to 16-bit resolution. When the value of 16-bit up/down counter and TIMER30\_PDR are identical in timer 30, a period match signal is generated and the period match interrupt of timer 30 takes place. The timer 30 A, B, and C match signals are generated and the A, B, and C match interrupts of timer 30 take place, when the 16-bit counter value are identical to the value of TIMER30\_xDR. The period and duty of the PWM output is determined by the TIMER30\_PDR (PWM period register), and TIMER30\_xDR (each channel PWM duty register).

$$\text{PWM Period} = [\text{TIMER30\_PDR}] \times \text{Source Clock}$$

$$\text{PWM Duty(A-ch)} = [\text{TIMER30\_ADR}] \times \text{Source Clock}$$

$$\text{PWM Duty(B-ch)} = [\text{TIMER30\_BDR}] \times \text{Source Clock}$$

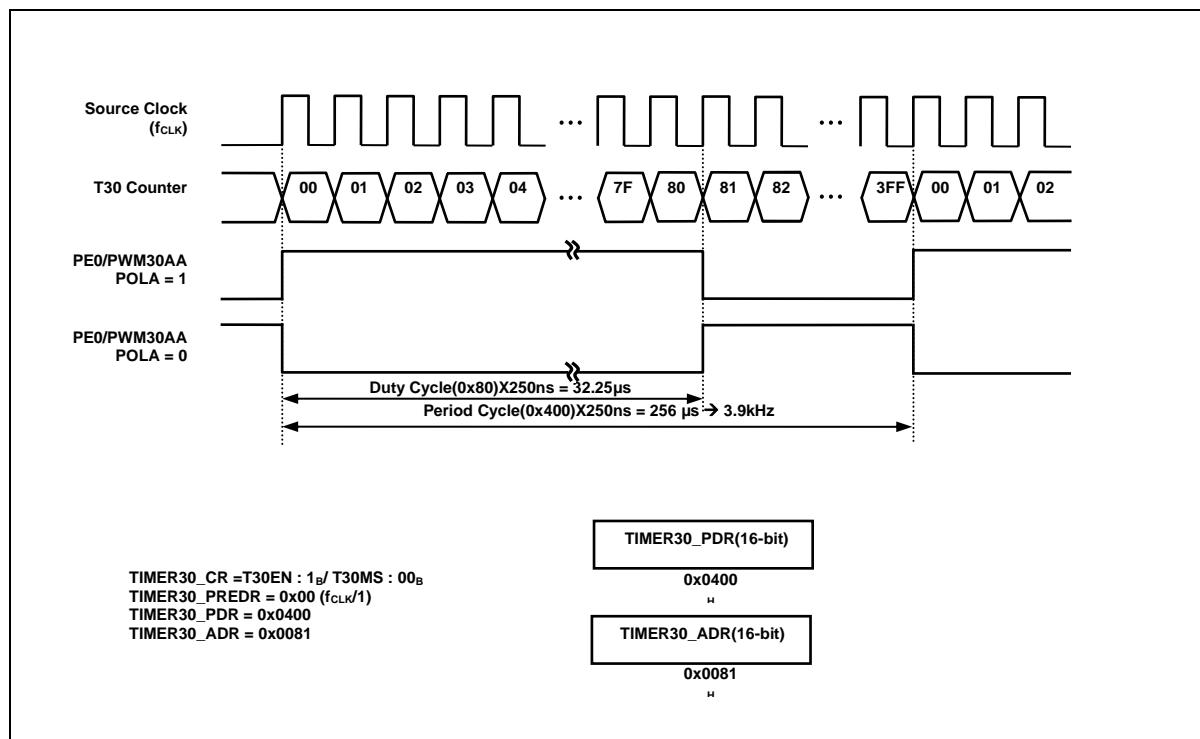

$$\text{PWM Duty(C-ch)} = [\text{TIMER30\_CDR}] \times \text{Source Clock}$$

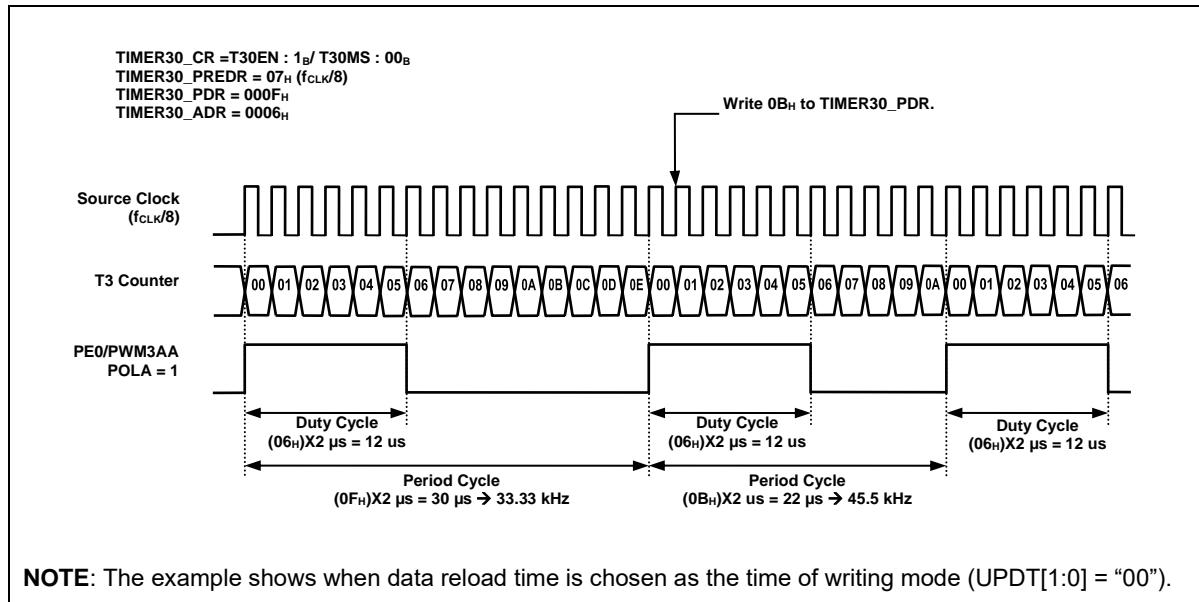

The POLA/POLB bit of TIMER30\_OUTCR register decides the polarity of PWM output. If the POLA/POLB bit is set to ‘1’, the PWM30xA/PWM30xB output is high level start and if the POLA/POLB bit is cleared to ‘0’, the PWM30xA/PWM30xB output is low level start, respectively.

**Table 51. PWM Channel Polarity**

<b>PxAOE</b>	<b>PxBQE</b>	<b>POLa</b>	<b>POLb</b>	<b>PWM3xA Pin Output</b>	<b>PWM3xB Pin Output</b>
1	1	0	0	Low level start	Low level start
		0	1	Low level start	High level start
		1	0	High level start	Low level start
		1	1	High level start	High level start

**NOTE:** Where x = A, B, and C.

**Figure 61. Example of PWM at 4 MHz**

**Figure 62. Example of Changing the Period in Absolute Duty Cycle at 4 MHz**

#### 12.4.3.1 Data reload time selection

Data reload time can be selected from “update data to buffer at the time of writing”, “update data to buffer at period match”, or “update data to buffer at bottom”.

#### 12.4.3.2 PWM output delay

Using the DLYEN bit, DLYPOS bit, and TIMER30\_DLY register can delay the PWM output. When DLYPOS is set to '0', the delay inserts in front of PWM30xA and behind PWM30xB pins. When DLYPOS is set to '1', the delay inserts behind PWM30xA and in front of PWM30xB pins. The settings of DLYEN bit, DLYPOS bit, and TIMER30\_DLY register apply identically to all PWM channels.

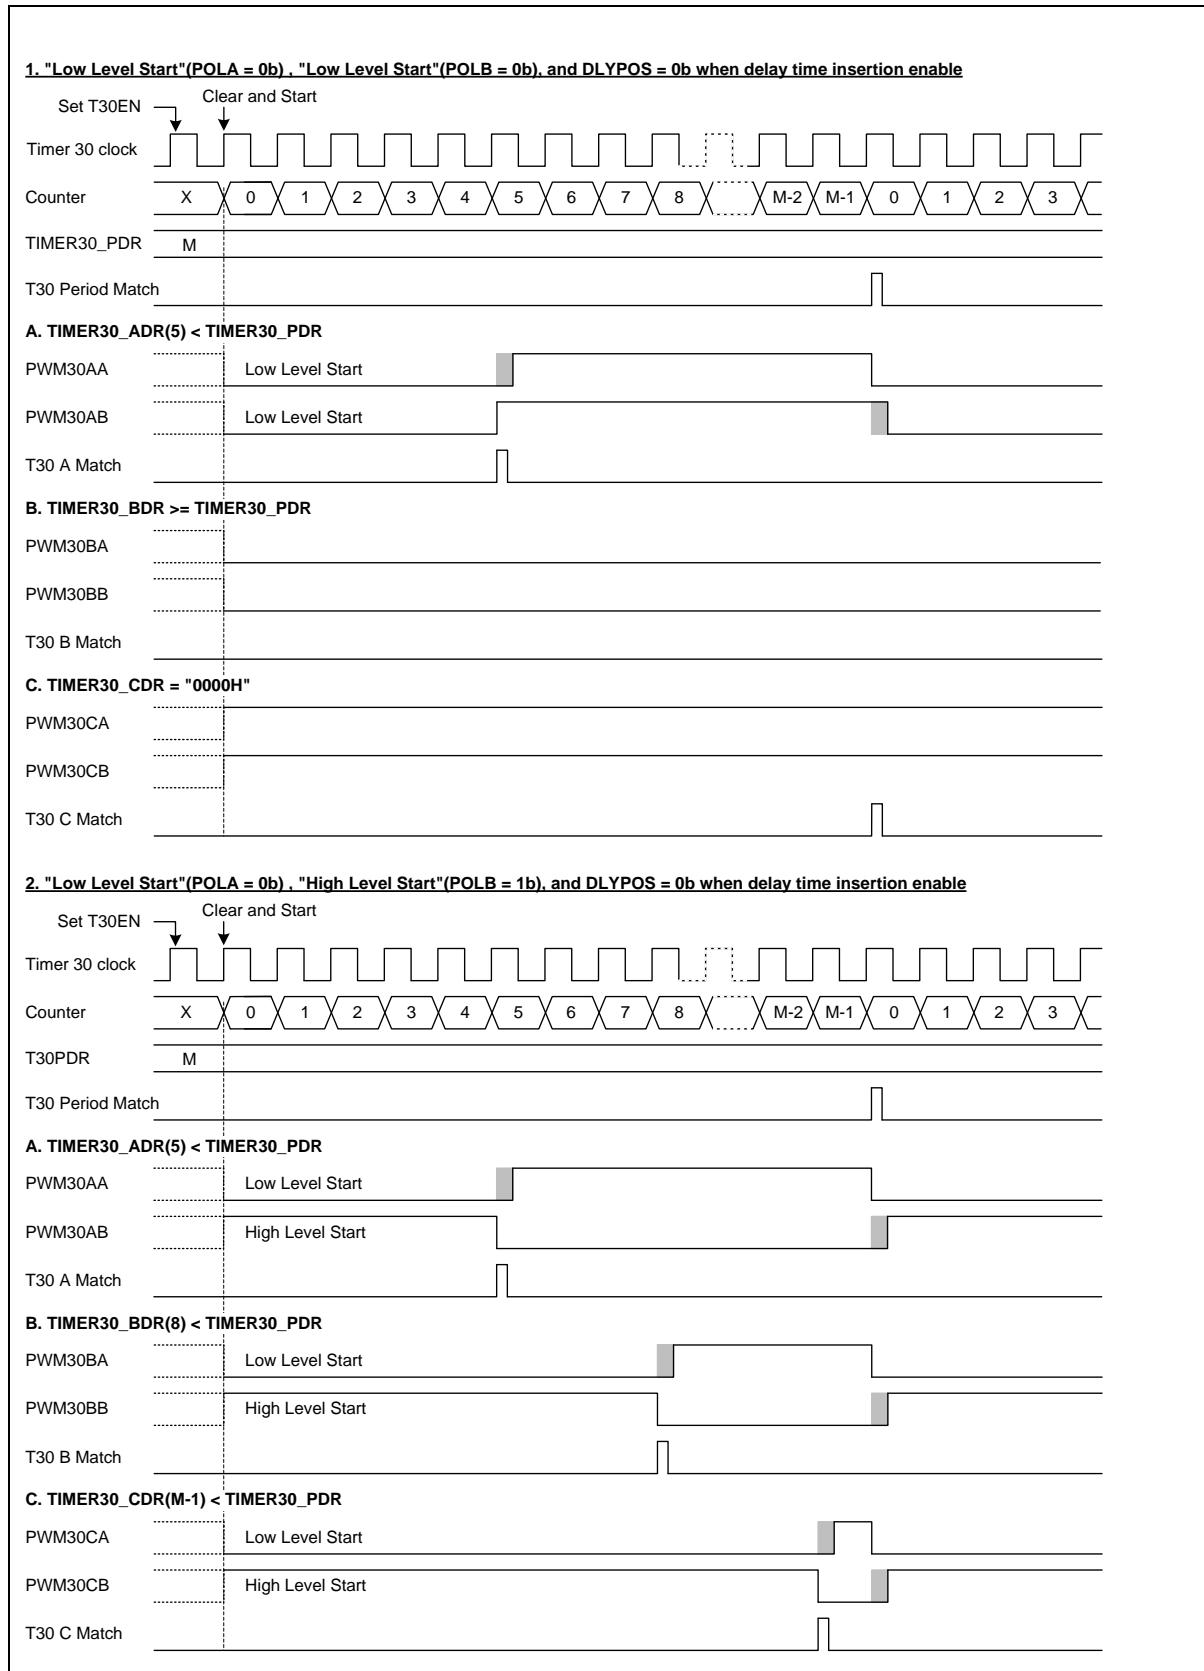

Figure 63. Interval Mode Timing Chart With “DLYPOS = 0”

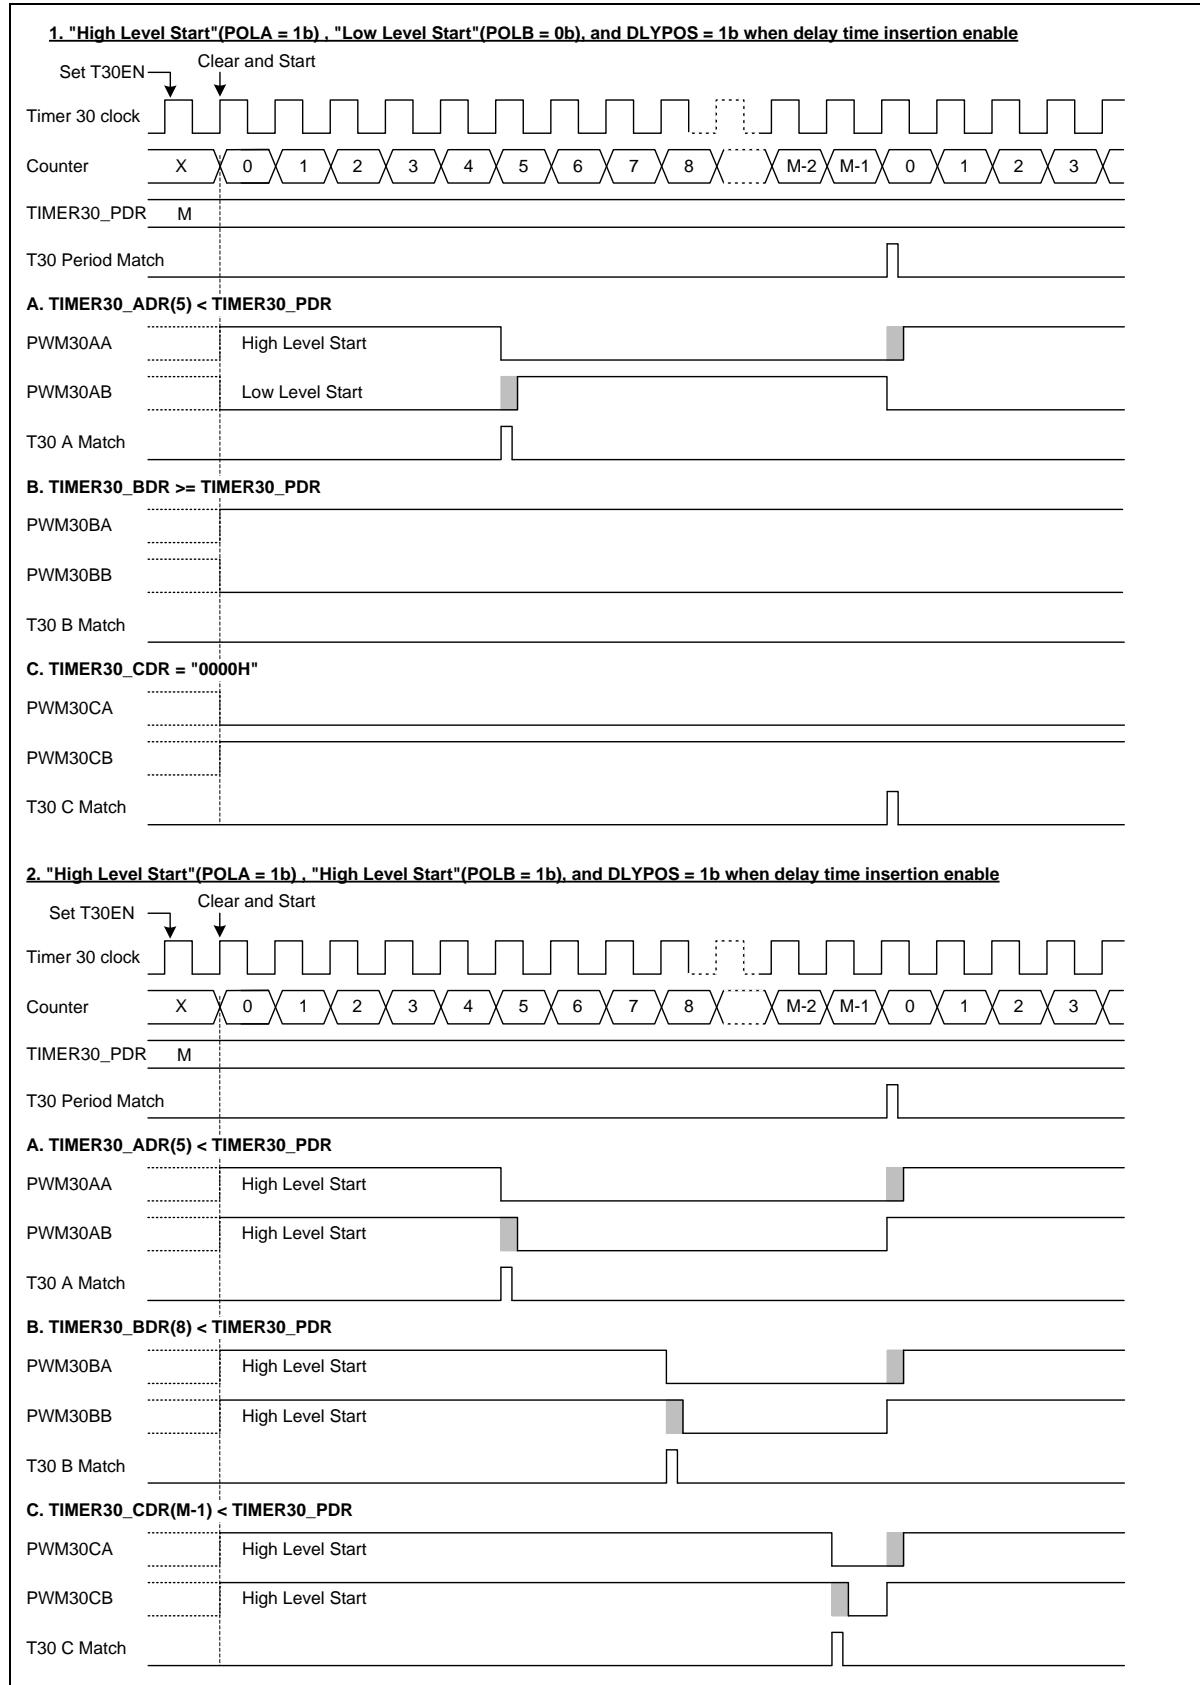

Figure 64. Interval Mode Timing Chart With "DLYPOS = 1"

#### 12.4.3.3

#### Back-to-Back Mode

Back-to-back mode is set by T30MS[1:0] as '10'. In the back-to-back mode, the 16-bit up/down counter repeats up/down count. In fact, the effective duty and period becomes twofold the register set values. If the TIMER30\_PDR's data value is set to "0x3210", 16-bit up/down counter will increment until it reaches 0x3210. At this point, a period match signal is generated and the period match interrupt takes place. Then the 16-bit up/down counter will decrement until it reaches 0x0000. At this point, the bottom interrupt takes place. It repeats in this manner.

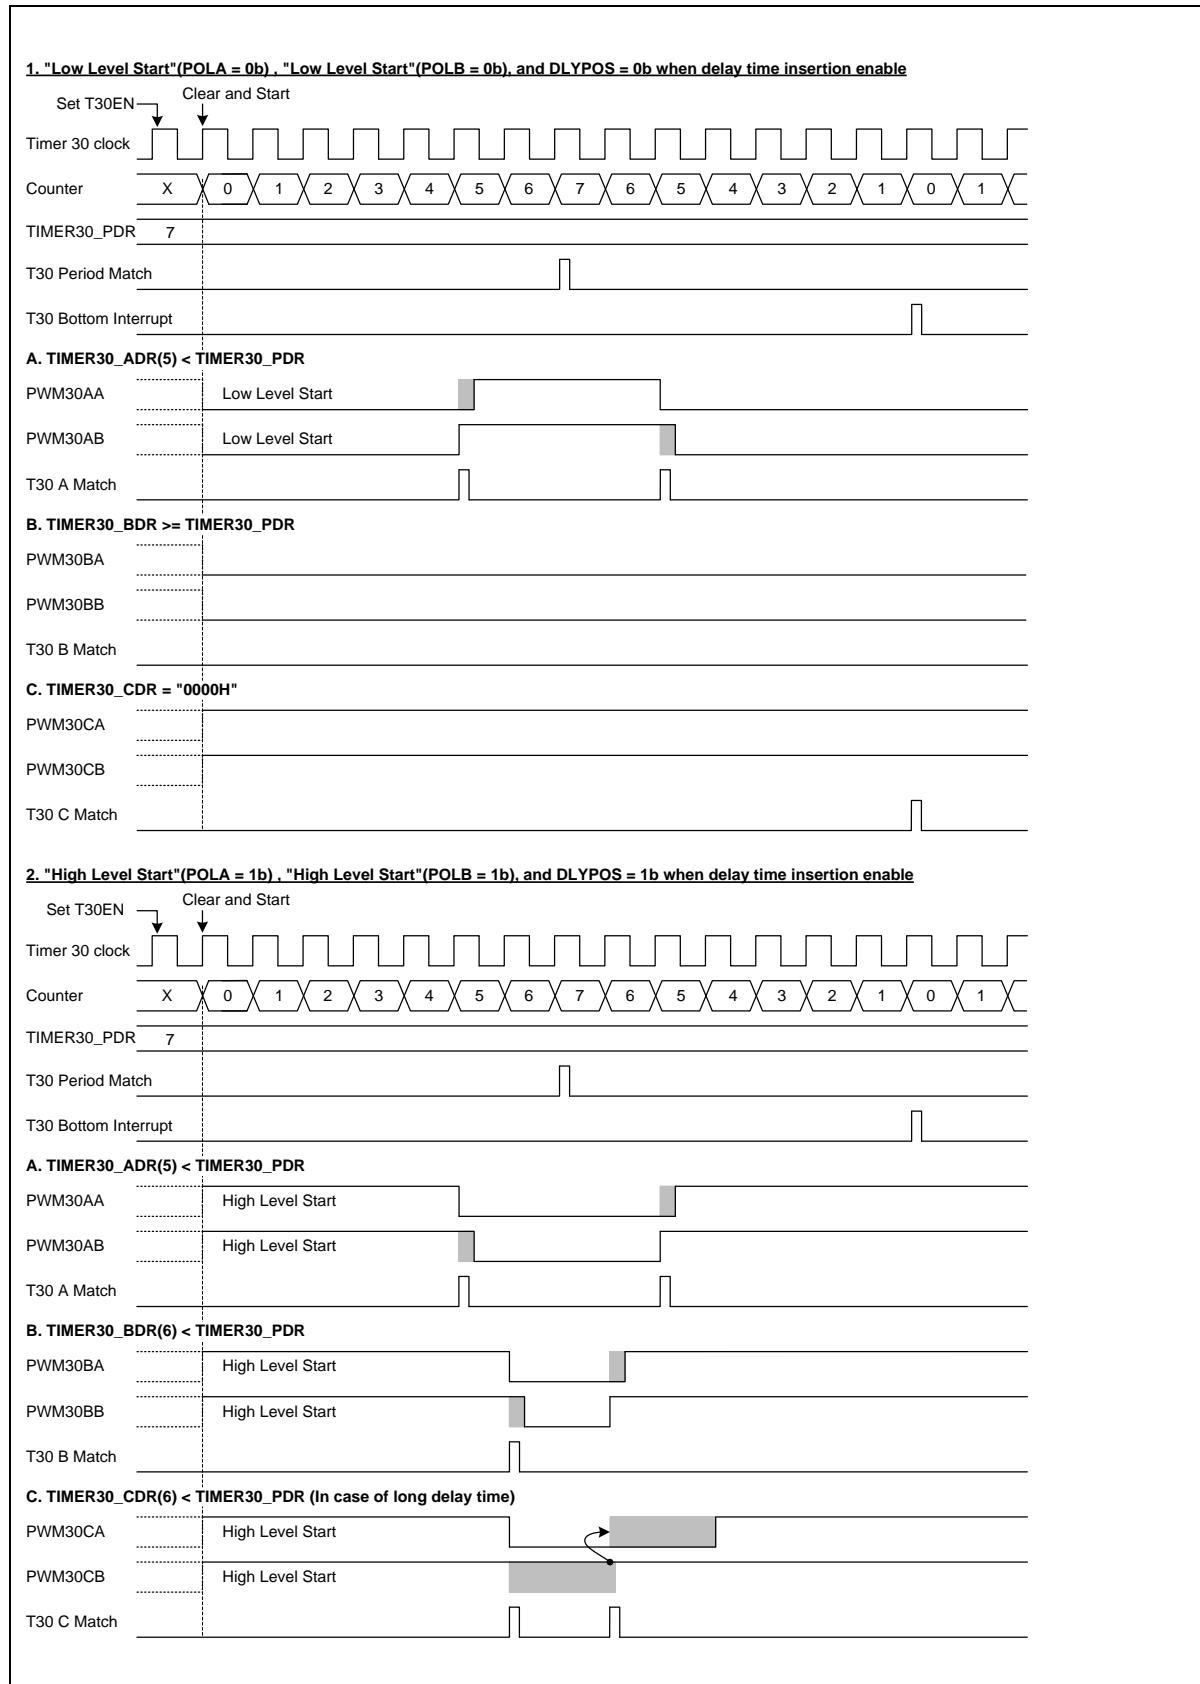

Figure 65. Back-to-Back Mode Timing Chart

#### 12.4.3.4 Emergency protective function

This protective function is used for emergency stop, when the PWM30xA/PWM30xB output high-impedance enable bit, HIZEN, is enabled. When the signal on the external BLNK input pin goes active (falling or rising edge triggered), the PWM30xA/PWM30xB ports are immediately disabled and a high-impedance interrupt takes place. The TIMER30\_HIZCR register is used for high-impedance control. The high-impedance source is the external BLNK input pin. The high-impedance edge can be selected by HEDGE bit as falling or rising edge. If the HIZST read value is '1', it indicates that the pins are under high-impedance state. To return from high-impedance state, the HZCLR bit should be set to '1'. If HIZSW bit is set to '1', PWM30xA/PWM30xB pins go into high impedance state by software. It can be used for debugging. (x: A, B and C)

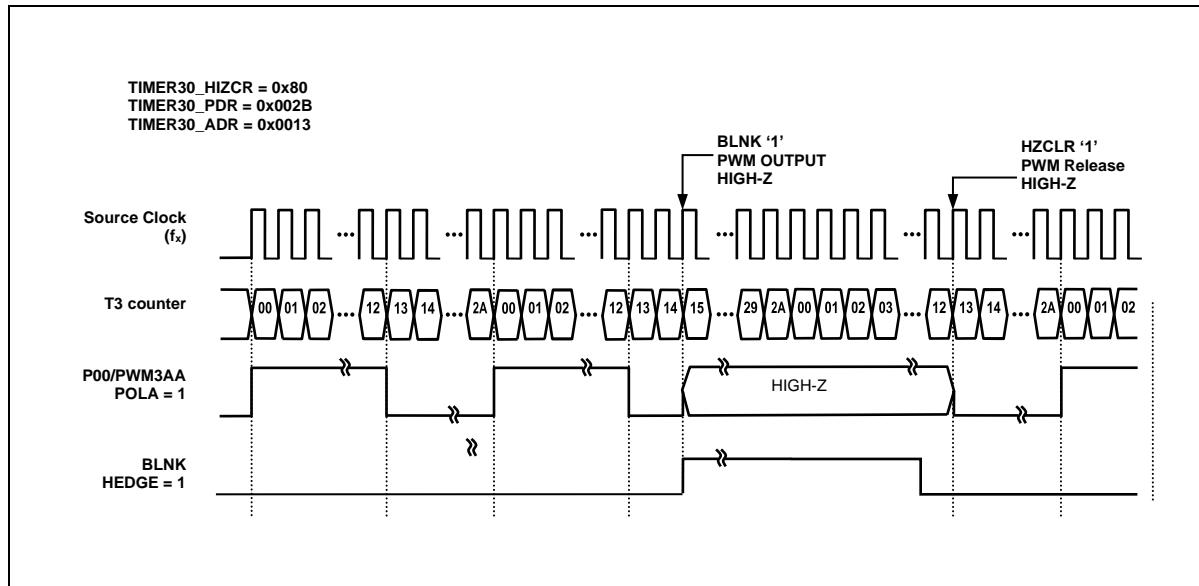

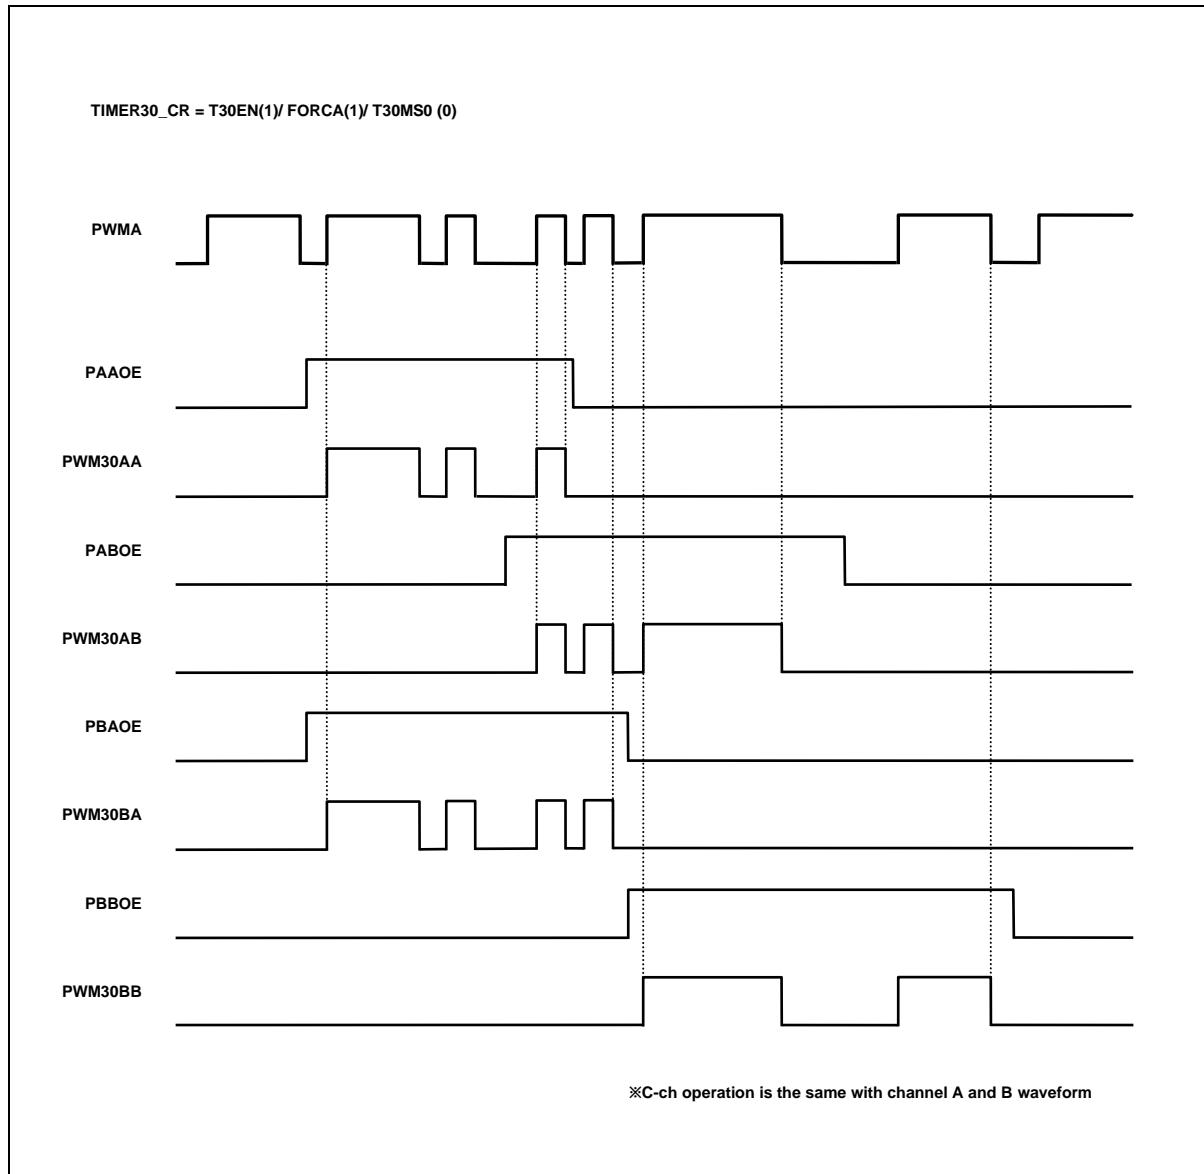

Figure 66. Example of PWM External Synchronization with BLNK Input (x: A, B and C)

### 12.4.3.5 FORCE A-Channel Mode

If FORCA bit is set to '1', it is possible to enable or disable all PWM output pins through PWM outputs generated from A-ch duty counter. Please note that the inversion outputs of A, B, C channel have the same A-ch output waveform.

**Figure 67. Example of Force A-Channel Mode**

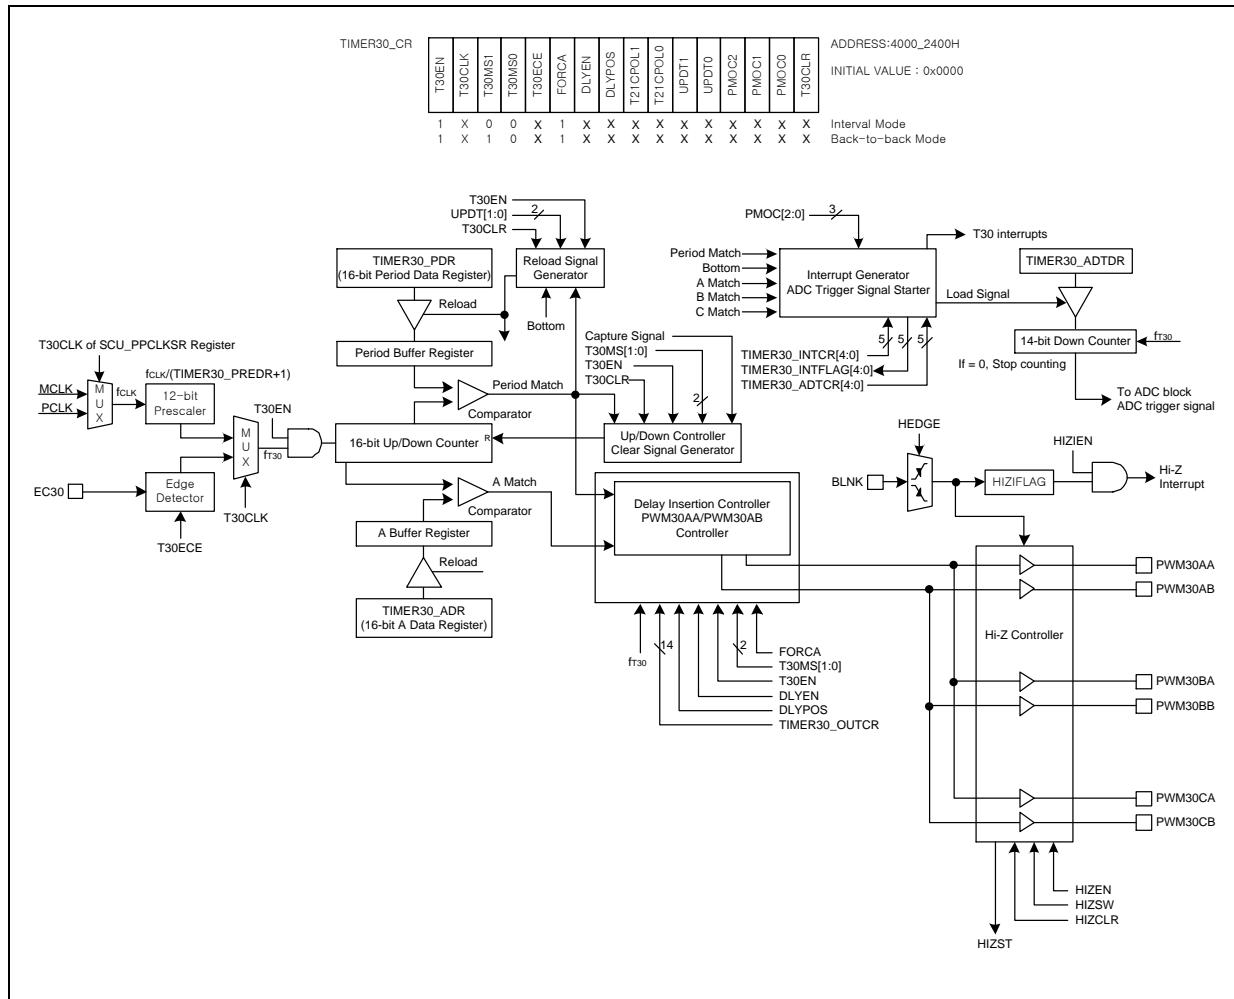

Figure 68. Force A-Channel Mode

#### 12.4.3.6 6-Channel Mode

If FORCA bit is set to '0', it is possible to enable or disable PWM output pin and inversion output pin through the duty counter of each channel. The inversion output is the reverse phase of the PWM output. A AA/AB output of the A-channel duty register, a BA/BB output of the B-channel duty register, a CA/CB output of the C-channel duty register are controlled respectively.

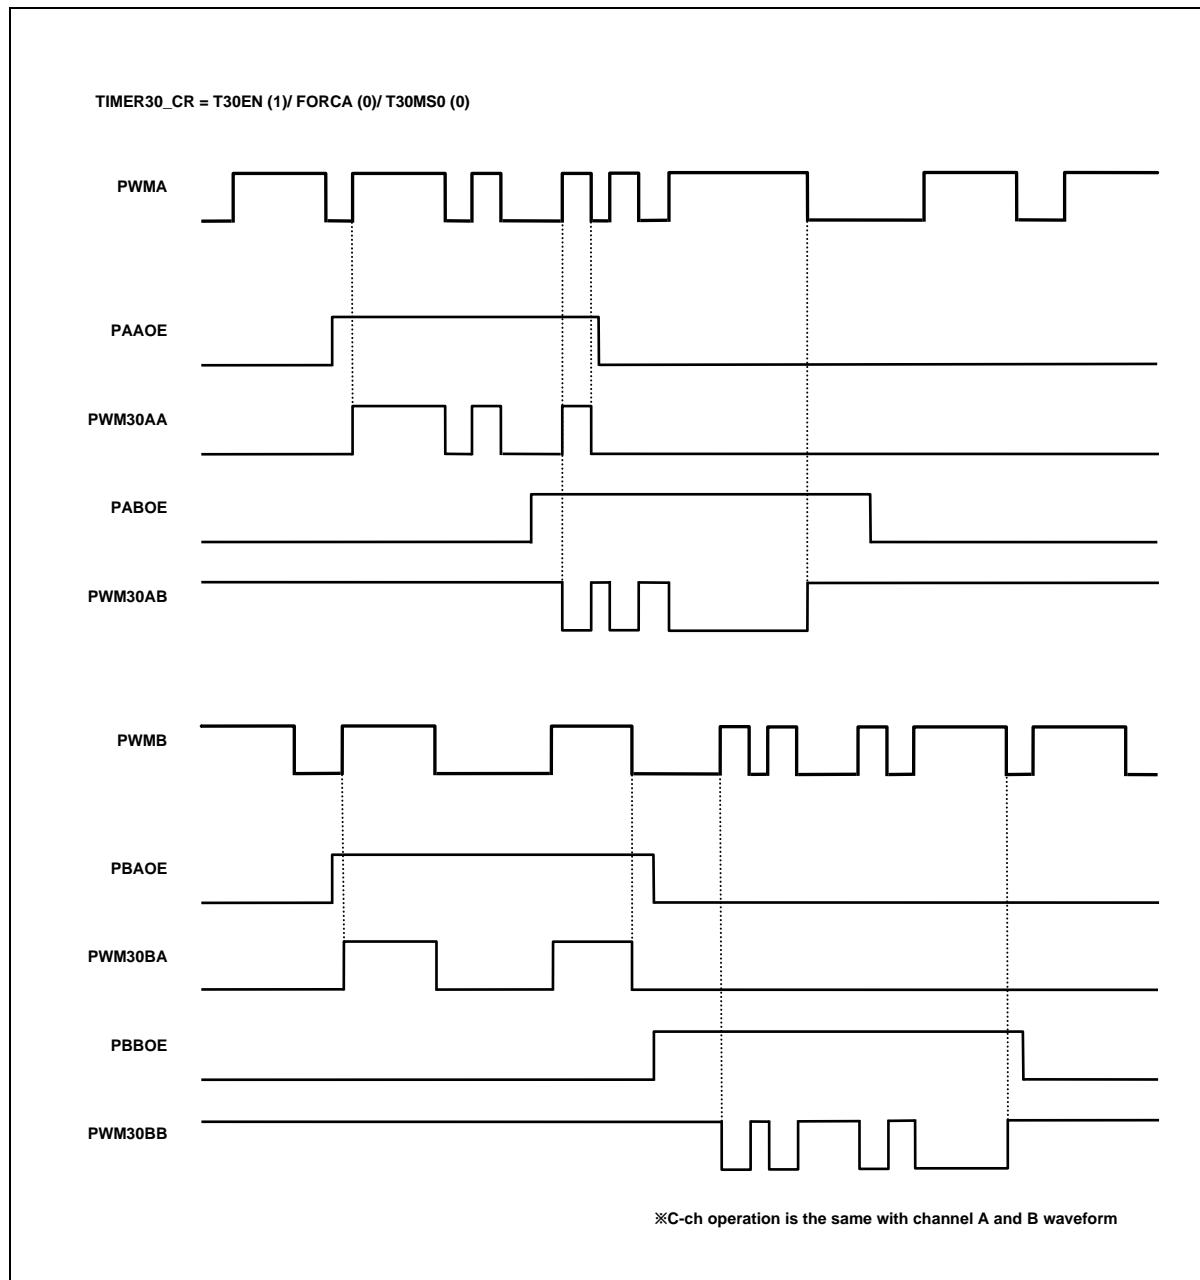

Figure 69. Example of 6-Channel Mode

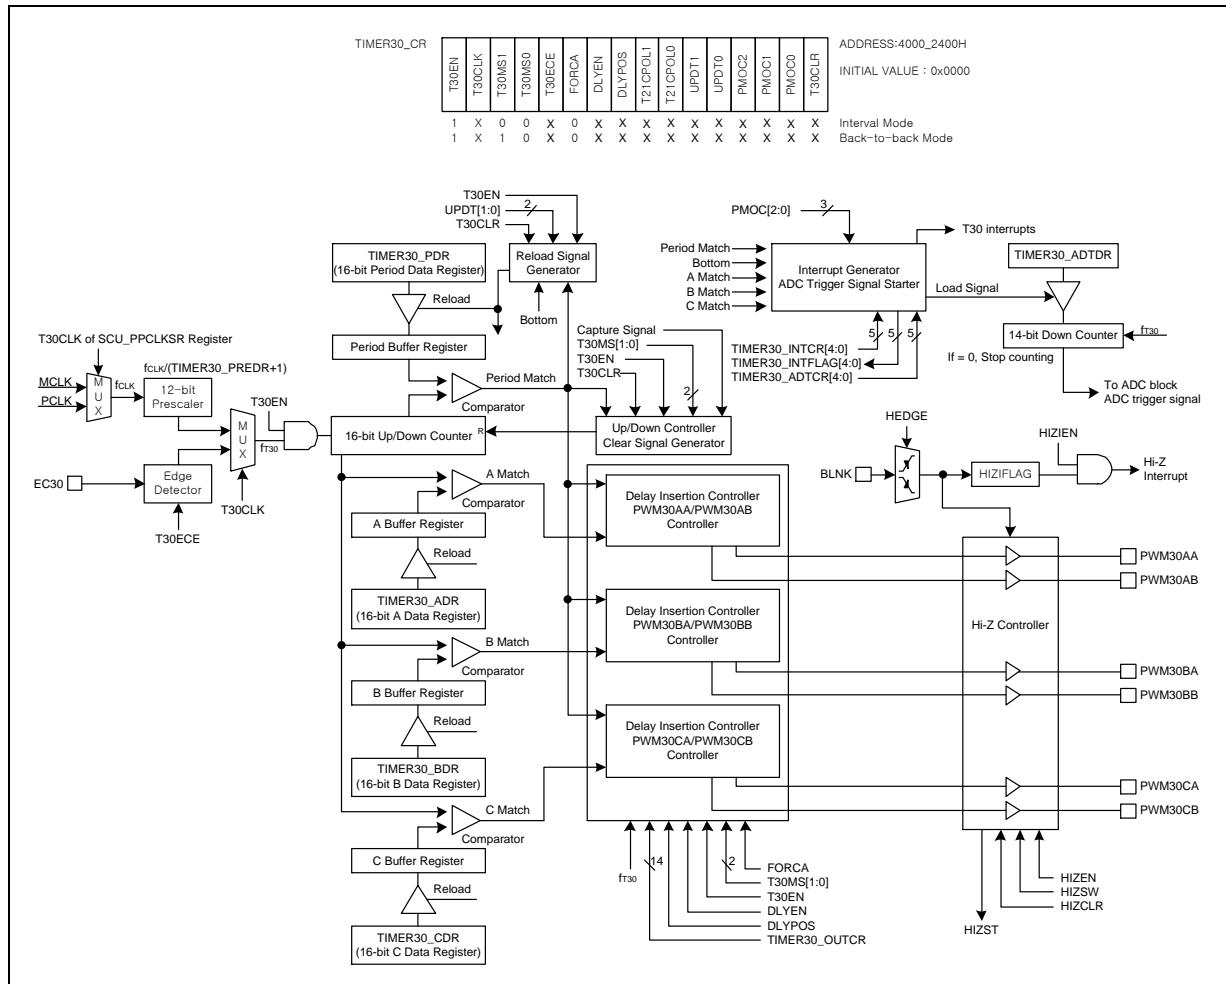

Figure 70. 6-Channel Mode

## 13 12-bit A/D Converter

ADC (Analog-to-Digital Converter) of A31G12x series allows conversion of an analog input signal to a corresponding 12-bit digital value. Its A/D module has fourteen analog inputs as shown in Figure 71. Output of the multiplexer is the input into the converter, which generates the result through successive approximation.

The A/D module has three registers such as a control register (ADC\_CR), a data register (ADC\_DR), and a prescaler data register (ADC\_PREDR). The channels to be converted are selected by setting ADSEL[3:0]. The register ADC\_DR contains the results of the A/D conversion. When the conversion is completed, the result is loaded into the ADC\_DR, A/D conversion status bit ADCIFLAG is set to '1', and the A/D interrupt is set. During A/D conversion, ADCIFLAG bit is read as '0'. Main features of the ADC are listed in the followings:

- 14-channel of analog inputs
- S/W (ADST), Timer trigger (T10/11/12 A match, ADC trigger signal from T30) support
- Conversion time: 58 clocks
- 5-bit Prescaler

### 13.3.3 ADC\_PREDR: A/D converter prescaler data register

ADC\_PREDR register is 32-bit size and accessible in 32/16/8-bit.

ADC_PREDR=0x4000_3008																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved																PRED															
0x000000																01111															
-																RW															
4	PRED															A/D Converter Prescaler Data.															
0																															

#### NOTES:

1. The prescaler sets the A/D conversion clock. The frequency of A/D converter should be less than 3MHz because the conversion time needs at least 20µs.
2. If the A/D frequency is more than 3MHz, malfunction may occur.

## 13.4 Functional description

### 13.4.1 ADC conversion timing

The A/D conversion process requires 4 steps (4 clock edges) to convert each bit and 10 clocks to set up A/D conversion. Therefore, total of 58 clocks are required to complete a 12-bit conversion: When the frequency of A/D converter is 1MHz, one clock cycle is 1 $\mu$ s. Each bit conversion requires 4 clocks. The conversion rate is calculated as follows:

$$4 \text{ clocks/bit} \times 12 \text{ bits} + \text{set-up time} = 58 \text{ clocks},$$

$$58 \text{ clock} \times 1 \mu\text{s} = 58 \mu\text{s at } 1\text{MHz}$$

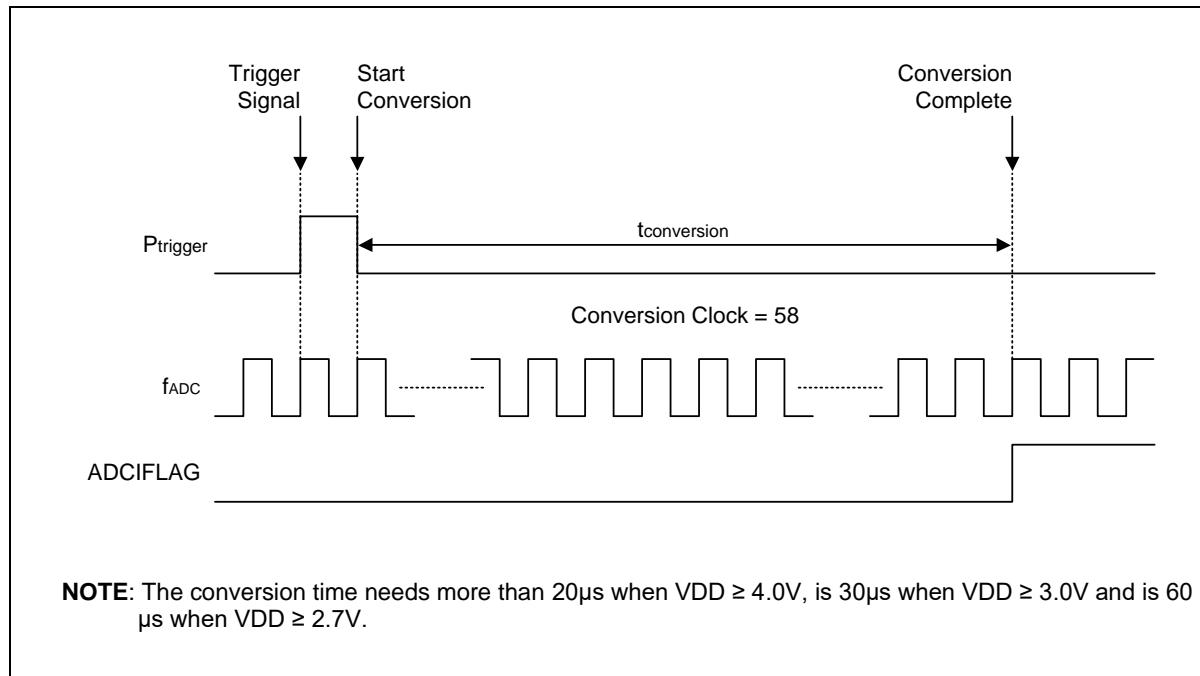

Figure 72. 12-bit ADC Converter Timing Chart

## 14 USART 10/11/12/13

USART (Universal Synchronous and Asynchronous serial Receiver and Transmitter) is a highly flexible serial communication device. The USART of A31G12x series features the followings:

- Full Duplex Operation. (Independent Serial Receive and Transmit Registers)
- Asynchronous or Synchronous Operation
- Baud Rate Generator
- Supports Serial Frames with 5,6,7,8, or 9 Data bits and 1 or 2 Stop bits
- Odd or Even Parity Generation, and Parity Check Supported by Hardware.
- Data OverRun Detection
- Framing Error Detection
- Three Separate Interrupts on TX Completion, TX Data Register Empty and RX Completion
- Double Speed Asynchronous communication mode

2	WAKEIEn	Asynchronous Wake-up Interrupt Enable in Deep Sleep Mode. When device is in deep sleep mode, if RXDn goes to low level, an interrupt can be requested to wake-up system (only UART mode). This bit should be cleared to '0' to receive Rx data.
0		Disable asynchronous wake-up interrupt.
1		Enable asynchronous wake-up interrupt. (Only used for wake-up)
1	TXEn	Enables the Transmitter unit. <b>NOTE:</b> The TXEn bit should be set to '1' while USTnEN bit is '0'.
0		Transmitter is disabled.
1		Transmitter is enabled.
0	RXEn	Enables the Receiver unit. <b>NOTE:</b> The RXEn bit should be set to '1' while USTnEN bit is '0'.
0		Receiver is disabled.
1		Receiver is enabled.

**NOTE:** The CPOLn and CPHAn bits should be changed while TXEn and RXEn bits are '0'

### 14.3.2 USARTn\_CR2: USARTn control register 2

USART module should be configured properly before running.

USARTn\_CR2 register is 32-bit size and accessible in 32/16/8-bit. (n = 10, 11, 12 and 13)

USART10_CR2=0x4000_3804, USART11_CR2=0x4000_3904 USART12_CR2=0x4000_3A04, USART13_CR2=0x4000_3B04																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

0x000000																0	0	0	0	0	0	0	0	0	0	0	0	0			
-																RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RO	RO			
9	USTnEN	Enable USARTn block. This bit can be cleared to '0b' during the corresponding TXEn and RXEn bits are all '0b'. 0 Disable USARTn block. 1 Enable USARTn block.																													
8	DBLSn	Selects receiver sampling rate. (only asynchronous mode) 0 Normal asynchronous operation. 1 Double speed asynchronous operation.																													
7	MASTERn	Selects master or slave in SPI or Synchronous mode and controls the direction of SCKn pin. 0 Slave operation. (External clock for SCKn) 1 Master operation. (Internal clock for SCKn)																													
6	LOOPSn	Control the Loop Back mode of USARTn for test mode. 0 Normal operation. 1 Loop back mode																													
5	DISSCKn	In synchronous mode operation, selects the waveform of SCKn output. 0 SCKn is free-running while USARTn is enabled in synchronous master mode. 1 SCKn is active while any frame is transferring.																													
4	USTnSSEN	This bit controls the SSn pin operation. (only SPI mode) 0 Disable. 1 Enable.																													
3	FXCHn	SPI port function exchange control. (only SPI mode) 0 No effect. 1 Exchange MOSIn and MISON function.																													
2	USTnSB	Selects the length of stop bit in Asynchronous or Synchronous mode. 0 1 Stop bit. 1 2 Stop bit.																													
1	USTnTX8	The ninth bit of data frame in Asynchronous or Synchronous mode of operation. Write this bit first before loading the USARTn_DR register 0 MSB (9th bit) to be transmitted is '0'. 1 MSB (9th bit) to be transmitted is '1'.																													
0	USTnRX8	The ninth bit of data frame in Asynchronous or Synchronous mode of operation. Read this bit before reading the receive buffer (only UART mode) 0 MSB (9th bit) to be received is '0'. 1 MSB (9th bit) to be received is '1'.																													

### 14.3.3 USARTn\_ST: USARTn status register

USARTn\_ST register is 32-bit size and accessible in 32/16/8-bit. (n = 10, 11, 12 and 13)

USART10\_ST=0x4000\_380C, USART11\_ST=0x4000\_390C  
USART12\_ST=0x4000\_3A0C, USART13\_ST=0x4000\_3B0C

7	DREn	Transmit Data Register Empty Interrupt Flag. The DRE flag indicates if the transmit data register (USARTn_DR) is ready to receive new data. If DRE is '1', the data register is empty and ready to be written.
	0	Transmit buffer is not empty.
	1	Transmit buffer is empty. This bit is cleared to '0' when '1' is written.
6	TXCr	Transmit Complete Interrupt Flag. This flag is set when the entire frame in the transmit shift register has been shifted out and there is no new data currently present in the transmit buffer.
	0	No request occurred.
	1	Transmit buffer is empty and the data in transmit shift register is shifted out completely. This bit is cleared to '0' when '1' is written.
5	RXCn	Receive Complete Interrupt Flag. This flag is set when there are unread data in the receive buffer and cleared when all the data in the receive buffer are read.
	0	There is no data unread in the receive buffer.
	1	There are more than 1 unread data in the receive buffer.
4	WAKEn	Asynchronous Wake-up Interrupt Flag. This flag is set when the RXD pin is detected as low while the CPU is in deep sleep mode. (only UART mode)
	0	No request occurred.
	1	Request occurred. The bit is cleared to '0' when '1' is written.
2	DORn	This bit is set if data OverRun takes place. While this bit is set, the incoming data frame is ignored. This flag is valid until the receive buffer is read.
	0	No Data OverRun.
	1	Data OverRun detected.
1	FEn	This bit is set if the first stop bit of next character in the receive buffer is detected as '0'. This bit is valid until the receive buffer is read. (only UART mode)
	0	No Frame Error.
	1	Frame Error detected.
0	PEn	This bit is set if the next character in the receive buffer has a Parity Error while parity is checked. This bit is valid until the receive buffer is read. (only UART mode)
	0	No Parity Error.
	1	Parity Error detected.

### 14.3.4 USARTn\_BDR: USARTn baud rate generation register

USARTn\_BDR register is 32-bit size and accessible in 32/16/8-bit. (n = 10, 11, 12 and 13)

USART10_BDR=0x4000_3810, USART11_BDR=0x4000_3910 USART12_BDR=0x4000_3A10, USART13_BDR=0x4000_3B10																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved																BDATA															
0x000000																0xFFFF															

11 BDATA The value in this register is used to generate internal baud rate in UART mode or to 0 generate SCK clock in SPI mode. To prevent malfunction, do not write '0' in UART mode and do not write '0' or '1' in synchronous or SPI mode.

### 14.3.5 USARTn\_DR: USARTn data register

USARTn\_DR register is 32-bit size and accessible in 32/16/8-bit. (n = 10, 11, 12 and 13)

USART10_DR=0x4000_3814, USART11_DR=0x4000_3914 USART12_DR=0x4000_3A14, USART13_DR=0x4000_3B14																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved																DATA															
0x000000																0x00															

7 DATA The USART Transmit buffer and Receive buffer share the same I/O address with this 0 DATA register. The Transmit Data Buffer is the destination for data written to the USARTn\_DR register. Reading the USARTn\_DR register returns the contents of the Receive Buffer. Write to this register only when the DRE flag is set. In SPI master mode, the SCK clock is generated when data are written to this register.

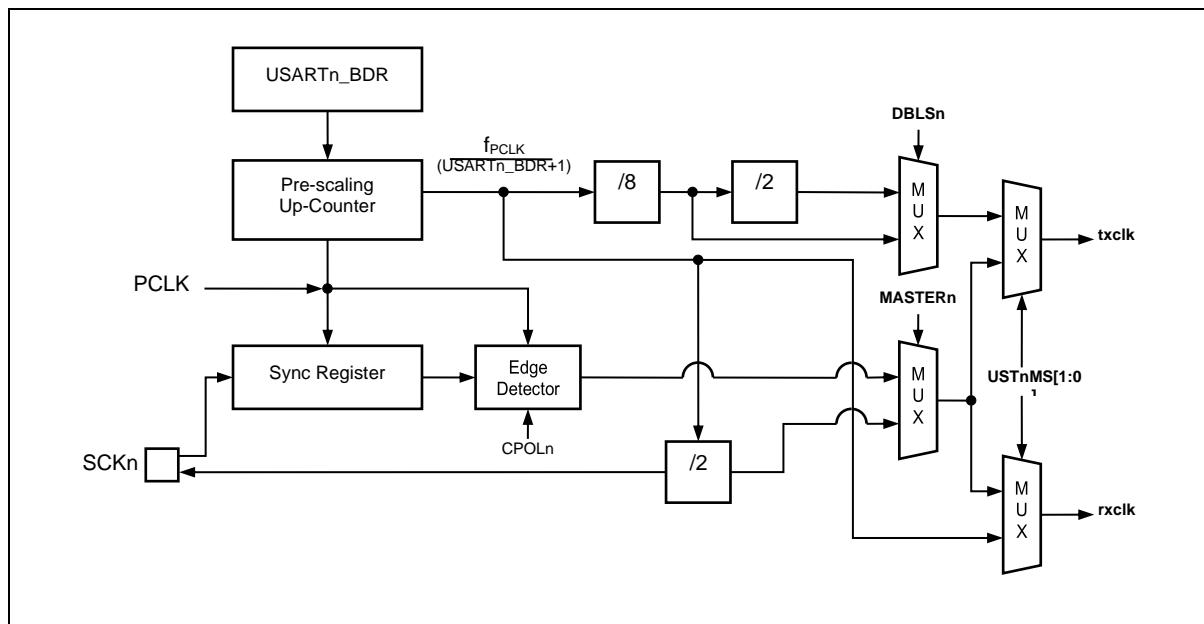

**NOTE:** This byte will not be written when the block is disabled or when both TXEn and RXEn bits are '0'.

## 14.4 Functional description

The USART comprises clock generator, transmitter and receiver. The clock generation logic consists of synchronization logic for external clock input used by synchronizing or SPI slave operation, and the baud rate generator for asynchronous or master (synchronous or SPI) operation.

The Transmitter consists of a single write buffer, a serial shift register, parity generator and control logic for handling different serial frame formats. The write buffer allows continuous transfer of data without any delay between frames. The receiver is the most complex part of the UART module due to its clock and data recovery units. The recovery unit is used for asynchronous data reception. In addition to the recovery unit, the receiver includes a parity checker, a shift register, a two-level receive FIFO (USARTn\_DR) and control logic. The receiver supports the same frame formats as the transmitter and can detect frame error, data overrun and parity errors. ( $n = 10, 11, 12$  and  $13$ )

### 14.4.1 USART clock generation

**Figure 75. Clock Generation Block Diagram (USART,  $n = 10, 11, 12$  and  $13$ )**

The clock generation logic generates the base clock for the transmitter and receiver. The USART supports four modes of clock operation, which are Normal asynchronous mode, Double speed asynchronous mode, Master synchronous mode and Slave synchronous mode.

The clock generation scheme for master SPI and slave SPI mode is the same as master synchronous and slave synchronous operation mode. The USTnMS[1:0] bits in USARTn\_CR1 register selects asynchronous or synchronous operation. Asynchronous double speed mode is controlled by the DBLS bit in the USARTn\_CR2 register.

The MASTER bit in USARTn\_CR2 register controls whether the clock source is internal (master mode, output pin) or external (slave mode, input pin). The SCKn pin is active only when the USART operates in synchronous or SPI mode.

Table 58 shows the equations for calculating the baud rate (in bps).

**Table 58. Equations for Calculating USART Baud Rate Register Settings (n = 10, 11, 12 and 13)**

Operating Mode	Equation for Calculating Baud Rate
Asynchronous Normal Mode (DBLSn=0)	Baud Rate = PCLK/(16(USARTn_BDR+1))
Asynchronous Double Speed Mode (DBLSn=1)	Baud Rate = PCLK/(8(USARTn_BDR+1))
Synchronous or SPI Master Mode	Baud Rate = PCLK/(2(USARTn_BDR+1))

#### 14.4.2 External clock (SCKn)

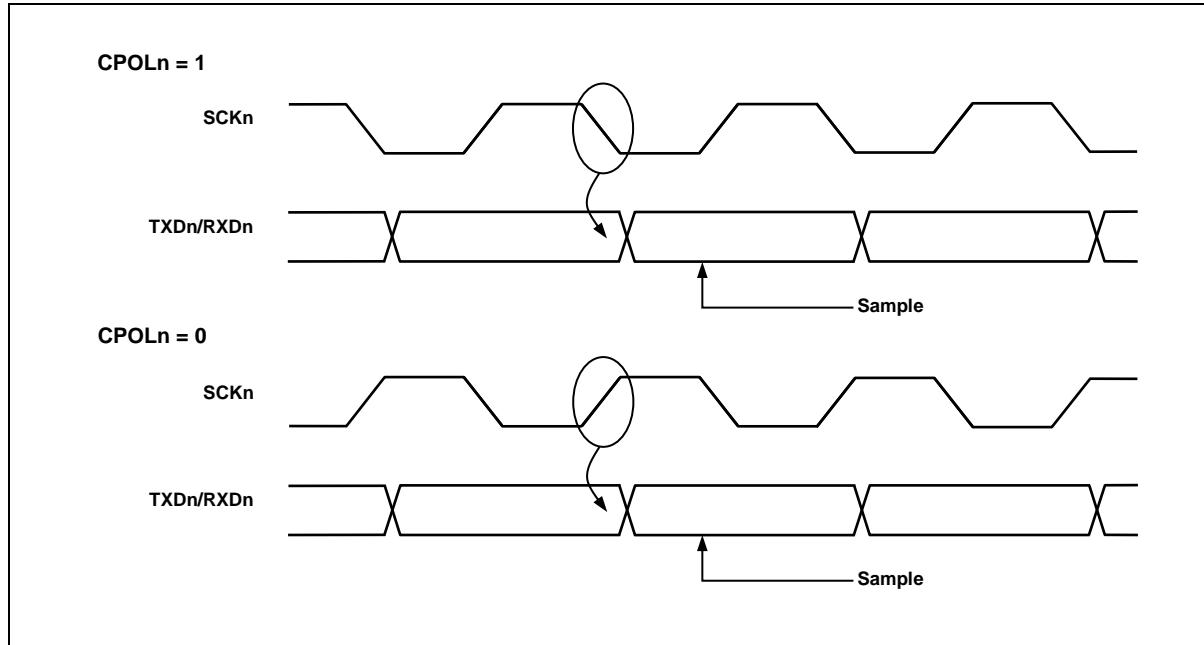

External clock is used in the Synchronous mode or in the SPI slave mode. External clock input from the SCKn pin is sampled by the synchronization logic to remove meta-stability. The output from the synchronization logic must be passed through an edge detector before it is used by the transmitter and the receiver. This process introduces two CPU clock period delay. The maximum frequency of the external SCKn pin is limited up to 2.5MHz.

#### 14.4.3 Synchronous mode operation

External clock is used in the Synchronous mode or in the SPI slave mode. When the Synchronous or the SPI mode is used, the SCKn pin will be used as either clock input (slave) or clock output (master).

Data sampling and transmission are issued on different edges of SCKn clock respectively. For example, if data input on RXDn (MISO in SPI mode) pin is sampled on the rising edge of SCKn clock, data output on TXDn (MOSI in SPI mode) pin is altered on the falling edge.

The CPOLn bit in USARTn\_CR1 register selects which SCKn clock edge is used for data sampling and which is used for data change. As shown in Figure 76 below, when CPOLn is zero, the data will be changed at rising SCKn edge and sampled at falling SCKn edge.

**Figure 76. Synchronous Mode SCKn Timing (USART, n = 10, 11, 12 and 13)**

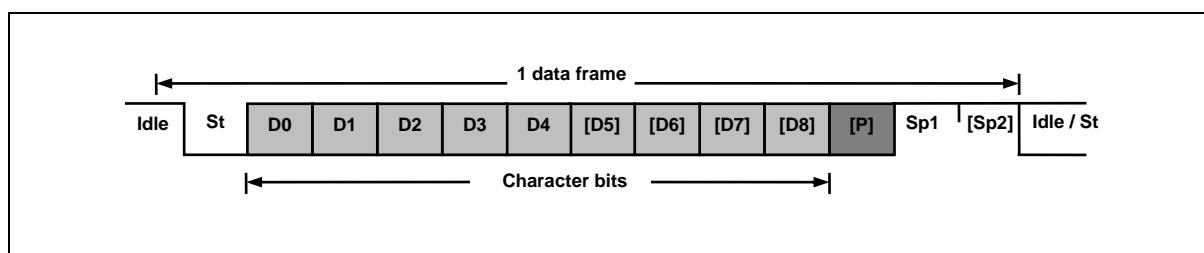

#### 14.4.4           UART data format

A serial frame is defined to be one character of data bits with synchronization bits (start and stop bits), and optionally a parity bit for error detection. The USART supports all 30 combinations of the followings as valid frame formats.

- 1 start bit
- 5, 6, 7, 8 or 9 data bits
- No, even or odd parity bit.
- 1 or 2 stop bits.

A frame starts with the start bit followed by the least significant data bit (LSB). Then the next data bits, up to nine, follow, ending with the most significant bit (MSB). If a parity function is enabled, the parity bit is inserted between the last data bit and the stop bit. A high-to-low transition on data pin is considered as a start bit.

When a complete frame is transmitted, it can be directly followed by a new frame, or the communication line can be set to an idle state. The idle state means high state of data pin. Figure 77 shows a possible combination of the frame formats. Bits inside brackets are optional.

**Figure 77. Frame Format (UART)**

1 data frame consists of the following bits

- Idle: No communication on communication line (TXDn/RXDn)
- St: Start bit (low)
- Dm: Data bits (0 to 8)

- P: Parity bit (even parity, odd parity, no parity)
- Sp: Stop bit (1 bit or 2 bits)

The frame format used by the UART is set by USTnS[2:0], USTnP[1:0] bits in the USARTn\_CR1 register and USTnSB bit in the USARTn\_CR2 register. The transmitter and the receiver use the same values. (n = 10, 11, 12 and 13)

#### 14.4.5           UART parity bit

The parity bit is calculated by doing an exclusive-OR of all data bits. If odd parity is used, the result of the exclusive-OR is inverted. The parity bit is located between the MSB and the first stop bit of a serial frame.

- $P_{even} = D_{m-1} \wedge \dots \wedge D_3 \wedge D_2 \wedge D_1 \wedge D_0 \wedge 0$
- $P_{odd} = D_{m-1} \wedge \dots \wedge D_3 \wedge D_2 \wedge D_1 \wedge D_0 \wedge 1$
- $P_{even}$ : Parity bit using even parity
- $P_{odd}$ : Parity bit using odd parity
- $D_m$ : Data bit n of the character

#### 14.4.6           UART transmitter

The UART transmitter is enabled by setting TXEn bit in the USARTn\_CR1 register. When the Transmitter is enabled, the TXDn pin should be set to TXDn function for the serial output pin in UART mode by the GPIO registers. Baud-rate, operation mode and frame format must be set up before starting any transmission. In Synchronous operation mode, the SCKn pin is used for transmission clock, so it should be selected to do SCKn function by the GPIO registers. (n = 10, 11, 12 and 13)

#### 14.4.6.1                   UART sending TX data

A data transmission is initiated by loading data to the transmit data register (USARTn\_DR register I/O location). The data to be written in transmit data register is moved to the shift register when the shift register is ready to send a new frame. The shift register is loaded with the new data if it is in idle state or immediately after the last stop bit of the previous frame is transmitted. When the shift register is loaded to the new data, it will transfer one complete frame according to the settings of the control registers. If 9-bit characters are used in the Asynchronous or the Synchronous operation mode, the 9<sup>th</sup> bit must be written to USTnTX8 bit in USARTn\_CR2 register before it is loaded to the transmit buffer (USARTn\_DR register). (n = 10, 11, 12 and 13)

#### 14.4.6.2                   UART transmitter flag and interrupt

The UART transmitter has two flags that indicate its state. One is USART data register empty flag (DREN) and the other is transmit completion flag (TXCn). Both flags can be used as interrupt sources.

DREN flag indicates whether the transmit buffer is ready to receive new data. This bit is set when the transmit buffer is empty and cleared when the transmit buffer contains data to be transmitted but has not yet been moved into the shift register.

When the data register empty interrupt enable (DRIEn) bit in USARTnCR1 register is set and the global interrupt is enabled, USARTn\_ST status register empty interrupt is generated while DREN flag is set.

Transmit complete (TXCn) flag bit is set when the entire frame in the transmit shift register has been shifted out. The TXCn flag can be cleared by writing '1' to TXCn bit in the USARTn\_ST register.

When transmit complete interrupt enable (TXCIEn) bit in the USARTn\_CR1 register is set and the global interrupt is enabled, UART transmit complete interrupt is generated while TXCn flag is set. (n = 10, 11, 12 and 13)

#### 14.4.6.3                   UART parity generator

The parity generator calculates the parity bit for the serial frame data to be sent. When parity bit is enabled (USTnP1=1), the transmitter control logic inserts the parity bit between the MSB and the first stop bit of the frame to be sent. (n = 10, 11, 12 and 13)

#### 14.4.6.4                   UART disabling transmitter

Disabling the transmitter by clearing the TXEn bit will not become effective until the current transmission is completed. When the transmitter is disabled, the TXDn pin can be used as a normal general purpose I/O (GPIO). (n = 10, 11, 12 and 13)

#### 14.4.7      **UART receiver**

The UART receiver is enabled by setting RXEn bit in the USARTn\_CR1 register. When the receiver is enabled, the RXDn pin should be set to RXDn function for the serial input pin in the UART mode by the GPIO registers. Baud-rate, operation mode and frame format must be set before serial reception. In Synchronous or SPI operation mode, the SCKn pin is used as a transfer clock input, so it should be selected to do SCKn function by the GPIO registers. (n = 10, 11, 12 and 13)

##### 14.4.7.1      **UART receiving RX data**

When the UART is in Synchronous mode or in Asynchronous mode, the receiver starts data reception if it detects a valid start bit (LOW) on RXDn pin. Each bit after the start bit is sampled at predefined baud-rate (asynchronous) or at sampling edge of SCKn (synchronous), and shifted into the receive shift register until the first stop bit of a frame is received. Even if there is a second stop bit in the frame, the second stop bit is ignored by the receiver. That is, receiving the first stop bit means that a complete serial frame is presented in the receiver shift register and contents of the shift register are to be moved into the receive buffer. The receive buffer is read by reading the USARTn\_DR register.

If 9-bit characters are used (USTnS[2:0] = "111"), the ninth bit is stored in the USTnRX8 bit position in the USARTn\_CR2 register. The ninth bit must be read from the USTnRX8 bit before reading the low 8 bits from the USARTn\_DR register. Likewise, the error flags, FEn, DORn, and PEn, must be read before reading the data from USARTn\_DR register. It is because error flags are stored in the same FIFO position of the receive buffer. (n = 10, 11, 12 and 13)

##### 14.4.7.2      **UART receiver Flag and interrupt**

The UART receiver has a flag that indicates the receiver's state. The receive complete (RXCn) flag indicates whether there are unread data in the receive buffer. This flag is set when there is unread data in the receive buffer and cleared when the receive buffer is empty. If the receiver is disabled (RXEn=0), the receiver buffer is flushed and the RXCn flag is cleared.

When the receive complete interrupt enable (RXCIEn) bit in the USARTn\_CR1 register is set and global interrupt is enabled, the UART receiver complete interrupt is generated while RXCn flag is set.

The UART receiver has three error flags, which are frame error (FEn), data overrun (DORn) and parity error (PEn). These error flags can be read from the USARTn\_ST register. As received data are stored in the 2-level receive buffer, these error flags are also stored in the same position of receive buffer. Therefore, before reading received data from USARTn\_DR register, USARTn\_ST register should be read first, which contains error flags.

The frame error (FEn) flag indicates state of the first stop bit. The FEn flag is '0' when the stop bit was correctly detected as '1', while the FEn flag is '1' when the stop bit was incorrect, i.e. detected as '0'. This flag can be used for detecting out-of-sync conditions between data frames.

The data overrun (DORn) flag indicates data loss due to a full receive buffer condition. DORn occurs when the receive buffer is full, and another new data is presented in the receive shift register to be stored into the receive buffer. After the DORn flag is set, all the incoming data are lost. To avoid data loss or to clear this flag, receive buffer must be read.

The parity error (PEn) flag indicates that the frame in the receive buffer had a parity error during reception. If parity check function is not enabled (USTnP1=0), the PEn bit is always read as '0'. (n = 10, 11, 12 and 13)

##### 14.4.7.3      **UART parity checker**

If parity bit is enabled (USTnP1=1), the parity checker calculates the parity of the data bits in incoming frame and compares the result with the parity bit from the received serial frame. (n = 10, 11, 12 and 13)

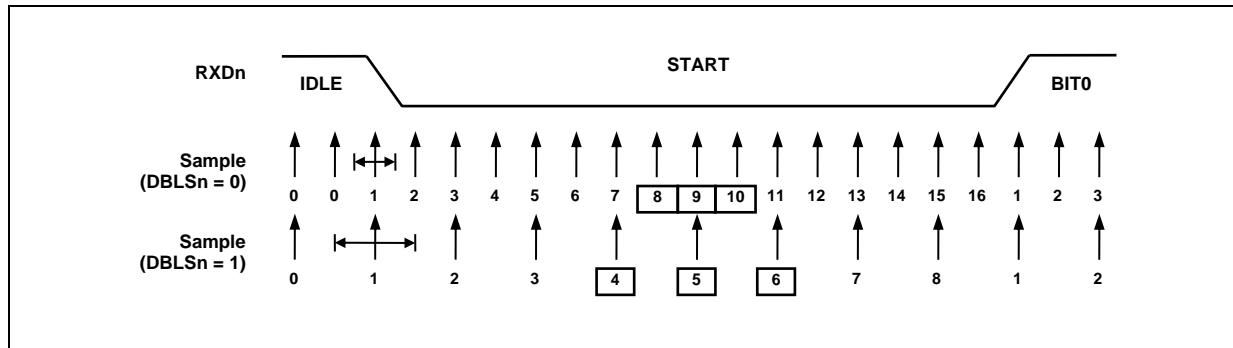

##### 14.4.7.4      **UART disabling receiver**

Unlike the transmitter, the receiver becomes inactive immediately after it is disabled by clearing RXEn bit. When the receiver is disabled, the receiver flushes the receive buffer, the remaining data in the buffer is all reset, and the RXDn pin can be used as a normal general purpose I/O (GPIO). (n = 10, 11, 12 and 13)

#### 14.4.7.5 Asynchronous data reception

To receive asynchronous data frame, the USART includes a clock and data recovery unit. The clock recovery logic is used for synchronizing the internally generated baud-rate clock to the incoming asynchronous serial frame on the RXDn pin. The data recovery logic samples and filters the incoming bits with a low pass filter, and removes the noise of RXDn pin.

Figure 78 illustrates the sampling process of the start bit of an incoming frame. The sampling rate is 16 times the baud-rate in normal mode and 8 times the baud-rate for double speed mode (DBLSn=1). The horizontal arrows show the synchronization variation due to the asynchronous sampling process. Note that larger time variation is seen using the double speed mode. (n = 10, 11, 12 and 13)

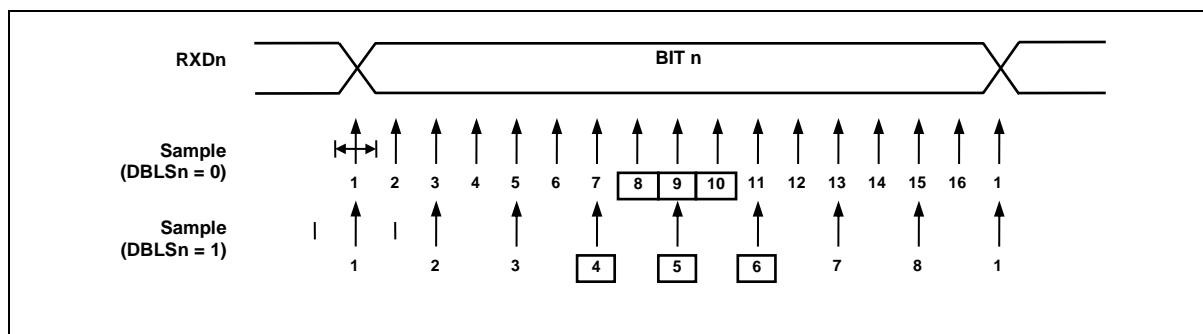

**Figure 78. Asynchronous Start Bit Sampling (n = 10, 11, 12 and 13)**

When the receiver is enabled (RXEn=1), the clock recovery logic tries to find a high-to-low transition on the RXDn line, which is the start bit condition. After detecting the high-to-low transition on RXDn line, the clock recovery logic uses samples 8, 9 and 10 for normal mode to detect whether valid start bit is received. If more than 2 samples have logical low level, it is considered that a valid start bit is detected and the internally generated clock is synchronized to the incoming data frame. Then the data recovery can begin. The synchronization process is repeated for each start bit.

As described above, when the receiver clock is synchronized to the start bit, the data recovery can begin. Data recovery process is almost the same as clock recovery process.

The data recovery logic samples each incoming bit 16 times for normal mode and 8 times for double speed mode, and uses sample 8, 9 and 10 to decide data value. If more than 2 samples have low levels, the received bit is considered as a logic '0' and if more than 2 samples have high levels, the received bit is considered as a logic '1'. The data recovery process is then repeated until a complete frame is received, including the first stop bit. The decided bit value is stored in the receive shift register in order. Note that the Receiver only uses the first stop bit of a frame. Internally, after receiving the first stop bit, the receiver is in idle state and waits to find the start bit. (n = 10, 11, 12 and 13)

**Figure 79. Asynchronous Sampling of Data and Parity Bit (n = 10, 11, 12 and 13)**

The process for detecting stop bit is the same as clock and data recovery process. That is, if 2 or more samples of 3 center values have high level, correct stop bit is detected, or else a frame error (FEn) flag is set. After deciding whether the first stop bit is valid or not, the receiver goes to idle state and monitors the RXDn line to check whether a valid high to low transition is detected (start bit detection). (n = 10, 11, 12 and 13)

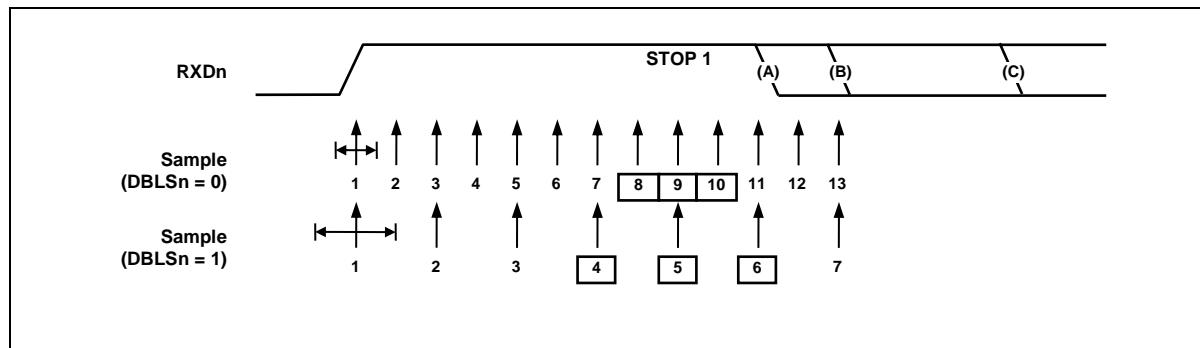

Figure 80. Stop Bit Sampling and Next Start Bit Sampling ( $n = 10, 11, 12$  and  $13$ )

#### 14.4.8 SPI mode

The USART can be set to operate in industrial standard SPI compliant mode. The SPI mode has the following features

- Full Duplex, Three-wire synchronous data transfer.
- Master and Slave Operation.
- Supports all four SPI modes of operation (mode 0, 1, 2, and 3).
- Selectable LSB first or MSB first data transfer.
- Double buffered transmit and receive.
- Programmable transmit bit rate.

When the SPI mode is enabled by configuring USTnMS[1:0] as "11", the slave select (SSn) pin becomes active LOW input in Slave mode operation if USTnSSEN bit is set to '1'. The SSn function is not automatically controlled in master mode operation even if USTnSSEN bit is set to '1'.

Note that during SPI mode of operation, the pin RXDn is renamed as MISO<sub>n</sub> and TXDn is renamed as MOSI<sub>n</sub> for compatibility to other SPI devices. (n = 10, 11, 12 and 13)

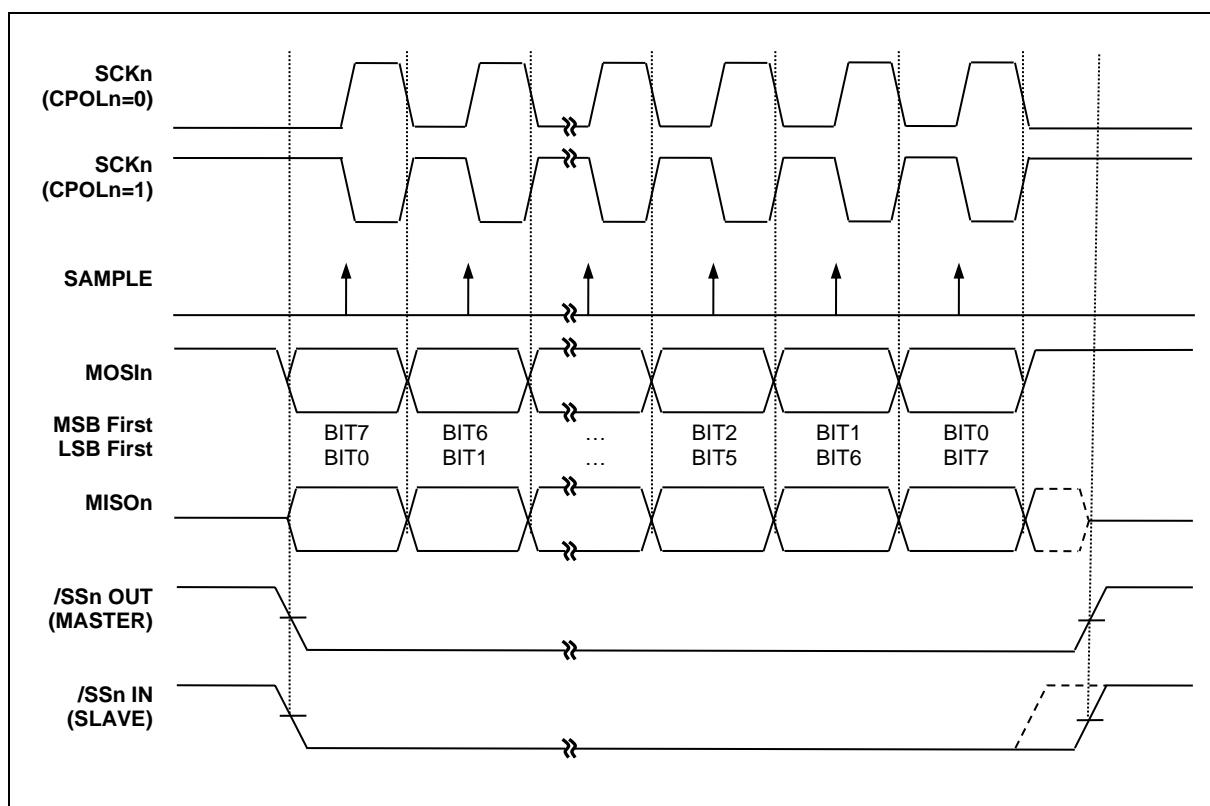

#### 14.4.9 SPI clock formats and timing

To accommodate a wide variety of synchronous serial peripherals from different manufacturers, the USART has a clock polarity bit (CPOLn) and a clock phase control bit (CPHAn) to select one of four clock formats for data transfers. CPOLn selectively inserts an inverter in series with the clock. CPHAn chooses between two different clock phase relationships between the clock and data. Note that CPHAn and CPOLn bits in USTnCR0 register have different meanings according to the USTnMS[1:0] bits, which decide the operating mode of USART.

Table 59 shows four combinations of CPOLn and CPHAn for SPI mode 0, 1, 2, and 3. (n = 10, 11, 12 and 13)

**Table 59. CPOL Functionality (n = 10, 11, 12 and 13)**

SPI Mode	CPOLn	CPHAn	Leading Edge	Trailing Edge
0	0	0	Sample (Rising)	Setup (Falling)
1	0	1	Setup (Rising)	Sample (Falling)
2	1	0	Sample (Falling)	Setup (Rising)
3	1	1	Setup (Falling)	Sample (Rising)

**Figure 81. USART SPI Clock Formats when CPHAn=0 (n = 10, 11, 12 and 13)**

When CPHAn=0, the slave begins to drive its MISON output with the first data bit value when SS<sub>n</sub> goes to active low. The first SCK<sub>n</sub> edge causes both the master and the slave to sample the data bit value on their MISON and MOSIn inputs, respectively. At the second SCK<sub>n</sub> edge, the USART shifts the second data bit value out to the MOSIn and MISON outputs of the master and slave, respectively. Unlike the case of CPHAn=1, when CPHAn=0, the slave's SS<sub>n</sub> input must go to its inactive high level between transfers. This is because the slave can prepare the first data bit when it detects falling edge of SS<sub>n</sub> input. (n = 10, 11, 12 and 13)

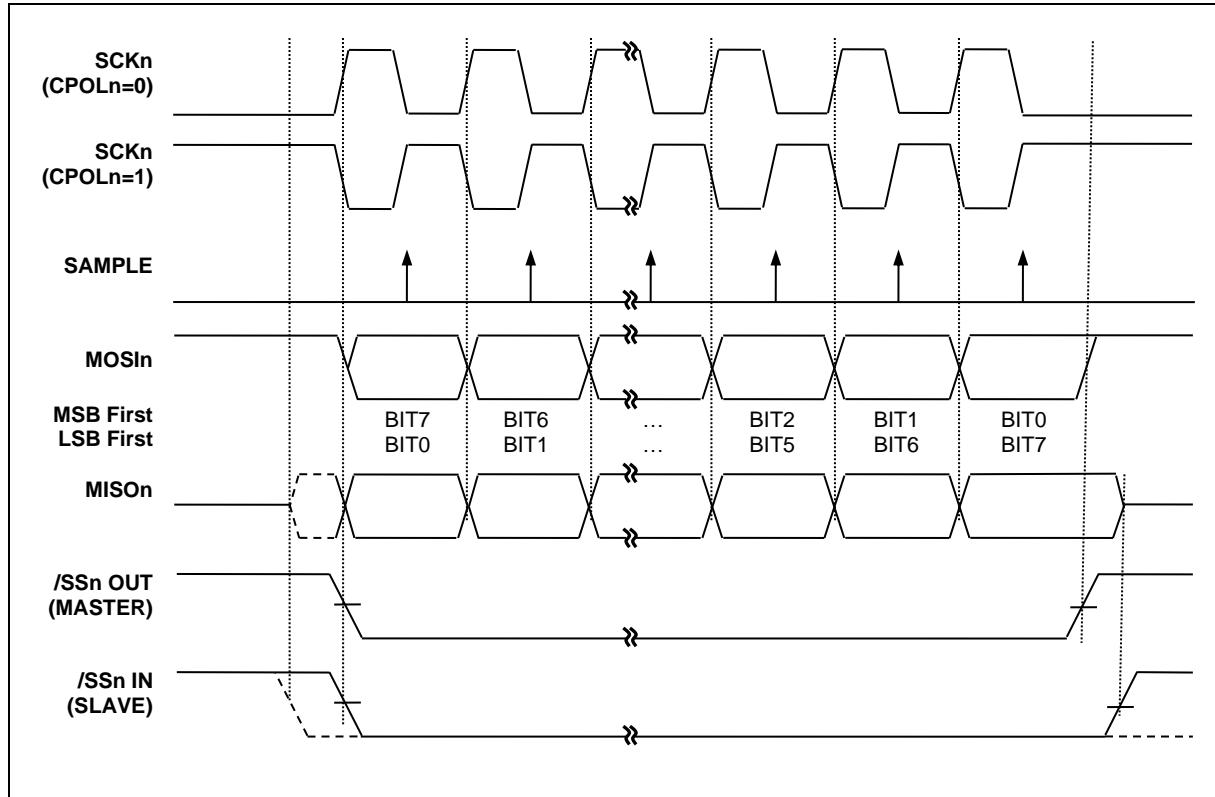

Figure 82. USART SPI<sub>n</sub> Clock Formats when CPHAn=1 (n = 10, 11, 12 and 13)

When CPHAn=1, the slave begins to drive its MISON output when SS<sub>n</sub> goes active low, but the data is not defined until the first SCK<sub>n</sub> edge. The first SCK<sub>n</sub> edge shifts the first bit of data from the shifter onto the MOSIn output of the master and the MISON output of the slave. The next SCK<sub>n</sub> edge causes both the master and slave to sample the data bit value on their MISON and MOSIn inputs, respectively. At the third SCK<sub>n</sub> edge, the USART shifts the second data bit value out to the MOSIn and MISON output of the master and slave respectively. When CPHAn=1, the slave's SS<sub>n</sub> input is not required to go to its inactive high level between transfers.

Because the SPI<sub>n</sub> logic reuses USART resources, SPI<sub>n</sub> mode of operation is similar to that of synchronous or asynchronous operation. A SPI<sub>n</sub> transfer is initiated by checking for the USART Data Register Empty flag (DREn=1) and then writing a byte of data to the USART<sub>n</sub>\_DR Register. In master mode of operation, even when transmission is not enabled (TXEn=0), writing data to the USART<sub>n</sub>\_DR register is necessary because the clock SCK<sub>n</sub> is generated from the transmitter block.

## 15   UART 0/1

There are built-in 2-channel of UART module (Universal Asynchronous Receiver/Transmitter) in A31G12x series. UART operation status including error status can be read from a status register.

A prescaler, which generates proper baud rate, exists for each UART channel. The prescaler can divide the UART clock source, PCLK, from 3 to 65535. Then, baud rate is generated using a 1:16 clock and an 8-bit precision clock tuning function.

The UART 0/1 of A31G12x series features the followings:

- Compatible with 16450
- Configurable standard asynchronous control bit (start, stop, and parity)
- Programmable 16-bit fractional baud generator
- Programmable serial communication
- 5-, 6-, 7- or 8- bit data transfer
- Even, odd, or no-parity bit insertion and detection
- 1-, 1.5- or 2-stop bit-insertion and detection
- 16-bit baud rate generation with 8-bit fraction control
- Hardware inter-frame delay function
- Stop bit error detection
- Detail status register

### 15.3.1 **UARTn\_RBR: UARTn receive data buffer register**

Received data will be read from UARTn\_RBR register. The maximum length of data is 8 bits. The last data received will stay in this register until a new byte is received.

UARTn\_RBR register is 32-bit size and accessible in 32/16/8-bit. (n = 0 and 1)

UART0\_RBR=0x4000\_4000, UART1\_RBR=0x4000\_4100

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

6	BREAK	Transfer Break Control. The TXDn pin will be driven at low state to notice the alert to the receiver.
0	Normal transfer mode.	
1	Break transmit mode.	
5	STICKP	Force Parity. This bit is effective when the PEN bit is set to '1'.
0	Disable parity stuck.	
1	Enable parity stuck. A parity is always the value of the PARITY bit.	
4	PARITY	Parity Mode and Parity Stuck Selection.
0	Odd parity mode.	
1	Even parity mode.	
3	PEN	Parity Bit Transfer Enable.
0	Disable parity transfer.	
1	Enable parity transfer.	
2	STOPBIT	Stop Bit Length Selection.
0	1 stop bit.	
1	1.5 or 2 stop bit. 1.5 stop bit in case of 5-bit data and 2 stop bit in case of 6/7/8-bit data.	
1	DLEN	Data Length Selection.
0	00	5-bit data length
	01	6-bit data length
	10	7-bit data length
	11	8-bit data length

Parity bit will be generated according to bit 3,4,5 of UARTn\_LCR register. Table 64 shows the variation of parity bit generation.

**Table 64. Interrupt ID and control of UARTn\_LCR**

STICKP	PARITY	PEN	Parity
X	X	0	No Parity
0	0	1	Odd Parity
0	1	1	Even Parity
1	0	1	Force parity as '1'
1	1	1	Force parity as '0'

### 15.3.6           UARTn\_DCR: UARTn data control register

UARTn\_DCR register is 32-bit size and accessible in 32/16/8-bit. (n = 0 and 1)

UART0_DCR=0x4000_4010, UART1_DCR=0x4000_4110																15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

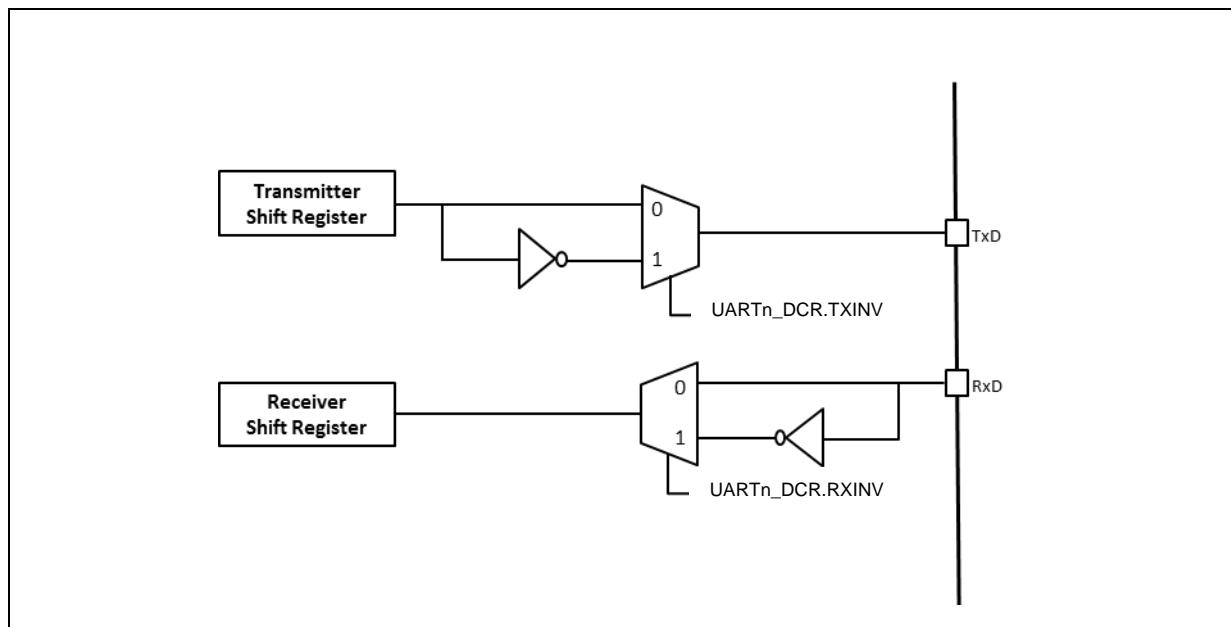

Figure 84. Data Inversion Control Diagram

### 15.3.7      **UARTn\_LSR: UARTn line status register**

UARTn\_LSR register is 32-bit size and accessible in 32/16/8-bit. (n = 0 and 1)

UART0_LSR=0x4000_4014, UART1_LSR=0x4000_4114																																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Reserved																TEM <b>T</b>	THRE	BI	FE	PE	OE	DR										
0x000000																1	1	0	0	0	0	0	0	-	RO							

6	TEM <b>T</b>	Transmit Empty.
	0	Transmit register has data or is transmitting.
	1	Transmit register is empty.
5	THRE	Transmit Holding Empty.
	0	Transmit hold register is not empty.
	1	Transmit hold register is empty
	<b>NOTE:</b> This bit will be set to '1' when it starts transmission.	
4	BI	Break Condition Indication.
	0	Normal status.
	1	Break condition is detected.
3	FE	Frame Error Indicator.
	0	No frame error.
	1	Frame error takes place. The receive character did not have a valid stop.
2	PE	Parity Error Indicator.
	0	No parity error.
	1	Parity error takes place. The receive character does not have correct parity information.
1	OE	Overrun Error Indicator.
	0	No overrun error.
	1	Overrun error takes place. Additional data arrived while RHR is full.
0	DR	Data Receive Indicator.
	0	No data in receive hold register.
	1	Data has been received and is saved in the receive hold register.

This register provides the status of data transfers between transmitter and receiver. A user can check the line status from this register. Bit 1,2,3,4 will raise the line status interrupt when RLSIE bit in UARTn\_IER register is set. Other bits can generate interrupts when their interrupt enable bits in UARTn\_IER register are set.

### 15.3.8           UARTn\_BDR: UARTn baud rate divisor latch register

UARTn\_BDR register is 32-bit size and accessible in 32/16/8-bit. (n = 0 and 1)

UART0_BDR=0x4000_4020, UART1_BDR=0x4000_4120																15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Reserved															BDR																	
0x0000															0x0000														RW			
-															-														-			
15	BDR	Baud Rate Divider Latch Value															Baud rate = fUARTnCLK/(16 x BDR[15:0] x 2).														NOTE: The UART block will not work if BDR[15:0] < 0x0003.	

To establish communication with the UART channel, baud rate should be set properly. The programmable baud rate generator provides divider number from 3 to 65535. Expected baud rate should be written to the 16-bit divider register (UARTn\_BDR). UART<sub>clock</sub> is PCLK.

Baud rate calculation formula is as follows:

$$\text{BDR} = \frac{\text{UART}_{\text{clock}}}{16 \times \text{BaudRate} \times 2}$$

In case of 40MHz UART<sub>clock</sub> speed, the divider value and error rate is shown in table

**Table 65. Example of Baud Rate Calculation (without BFR)**

UART <sub>clock</sub> = 40MHz		
Baud rate	Divider	Error (%)
1200	1041	0.06%
2400	520	0.16%
4800	260	0.16%
9600	130	0.16%
19200	65	0.16%
38400	32	1.73%
57600	21	3.34%
115200	10	8.51%

### 15.3.9           UARTn\_BFR: UARTn baud rate fraction counter register

UARTn\_BFR register is 32-bit size and accessible in 32/16/8-bit. (n = 0 and 1)

UART0\_BFR=0x4000\_4024, UART1\_BFR=0x4000\_4124

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved														BFR																	
0x000000														0x00														RW			

7	BFR	Fraction Counter value.
0	0	Disable fraction counter.
N		Fraction compensation mode under operation. Fraction counter is incremented by FCNT.
<b>NOTE:</b>		
8-bit fractional counter will count up by FCNT value every (baud rate)/16 period and whenever fractional counter overflow is happen, the divisor value will increment by 1. So this period will be compensated. Then next period, the divisor value will return to original set value.		

**Table 66. Example of Baud Rate Calculation**

<b>UART<sub>clock</sub> = 40MHz</b>			
<b>Baud rate</b>	<b>Divider</b>	<b>FCNT</b>	<b>Error (%)</b>
1200	1041	170	0.00%
2400	520	213	0.00%
4800	260	106	0.00%
9600	130	53	0.00%
19200	65	26	0.00%
38400	32	141	0.00%
57600	21	179	0.01%
115200	10	217	0.03%

$$\text{FCNT} = \text{Float} * 256$$

FCNT value can be calculated using the above equation. For example, when the target baud rate is 4800 bps and  $\text{UART}_{\text{clock}}$  is 40MHz, the BDR value is 260.4167. The integer 260 is be the BDR value and floating number 0.4167 lead to an FNCT value as follows:

$$\text{FCNT} = 0.4167 * 256 = 106.6667, \text{ and thus the FCNT value is 106.}$$

8-bit fractional counter will count up by FCNT value every (baud rate)/16 periods and whenever fractional counter overflow takes place, the divisor value will increment by 1 and compensate this period. Then, the divisor value will return to its original value.

### 15.3.10           UARTn\_IDTR: UARTn inter-frame delay time register

UARTn\_IDTR register is 32-bit size and accessible in 32/16/8-bit. (n = 0 and 1)

UART0_IDTR=0x4000_4030, UART1_IDTR=0x4000_4130																15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
Reserved																SMS	DMS	Reserved			WAITVAL												
0x000000																1	1	000			000												
-																RW	RW	I			RW												
7	SMS	Start Bit Multi Sampling Enable.																															
0		Multi sampling is disabled for start bit, Single sampling will be done at 8/16 baud rate for the start bit.																															
1		Multi sampling is enabled for start bit. Sampling is done 3 times at 7/16, 8/16, and 9/16 baud rate. Dominant value among 3 samples will be selected for the start bit.																															
6	DMS	Data Bit Multi sampling enable.																															
0		Multi sampling is disabled for data bit, Single sampling will be done at 8/16 baud rate for the data bit.																															
2	WAITVAL	Wait Time Value. Dummy delay can be inserted between 2 Continuous Transmits.																															
0		Wait Time = WAITVAL[2:0]/(Baud Rate)																															

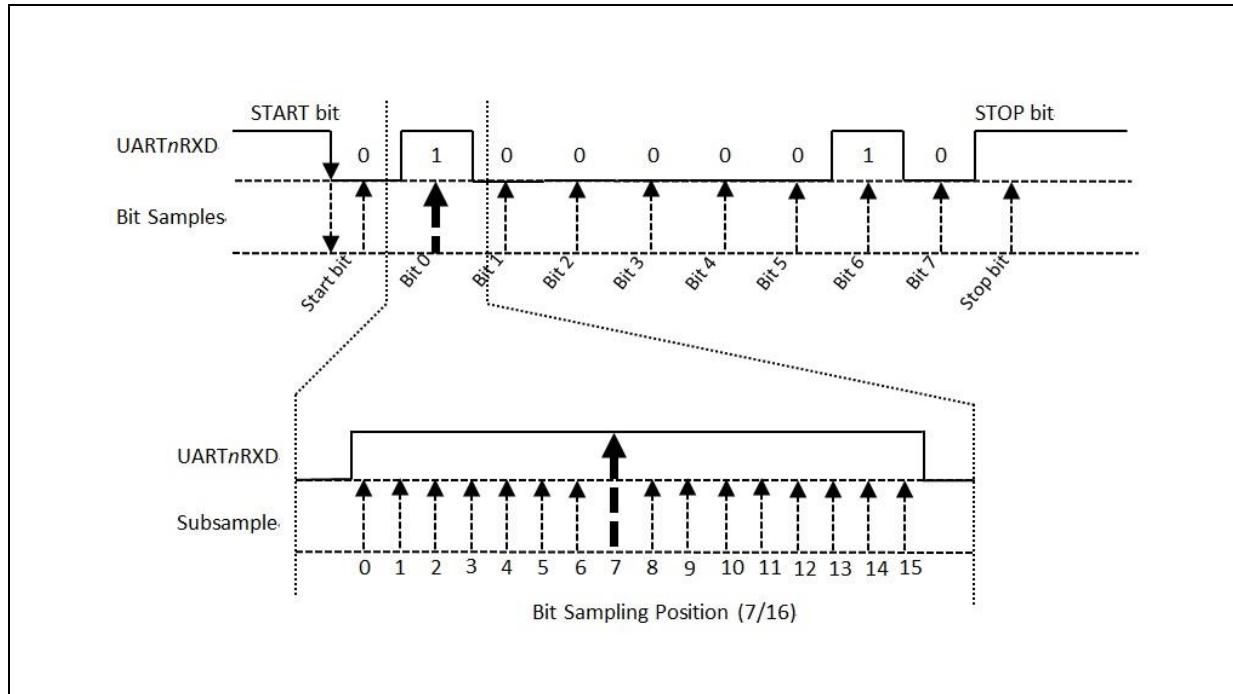

## 15.4 Functional description

The UART module is compatible with 16450 UART. Additionally, fractional baud rate compensation logic is provided. It does not have an internal FIFO block.

### 15.4.1 Receiver sampling timing

The UART of A31G12x series operates at the following timing as shown in Figure 85.

If falling edge is detected on the receive line, the UART considers it as a start bit. From then on, the UART oversamples 1-bit 16 times and detects the bit value at the 7<sup>th</sup> sample.

**Figure 85. Sampling Timing of UART Receiver**

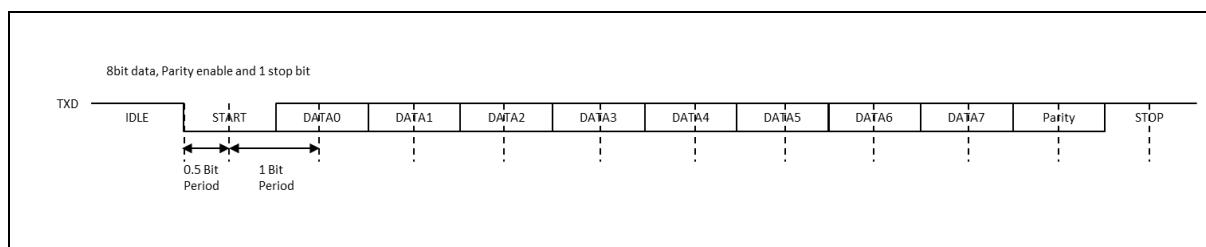

It is recommended to enable debounce settings in the PCU block to enhance the immunity to external glitch noise.

### 15.4.2 Transmitter

The transmitter has a data transmission function. The start bit, data bits, optional parity bit, and stop bit shift in series, the least significant bit shifting first.

The number of data bit is selected in DLEN[1:0] in the UARTn\_LCR register. The parity bit is set according to the PARITY and PEN bits in the UARTn\_LCR register. If the parity type is even, the parity bit depends on one-bit sum of all data bits. For odd parity, the parity bit is an inverted sum of all data bits. The number of stop bits is selected in the STOPBIT in the UARTn\_LCR register.

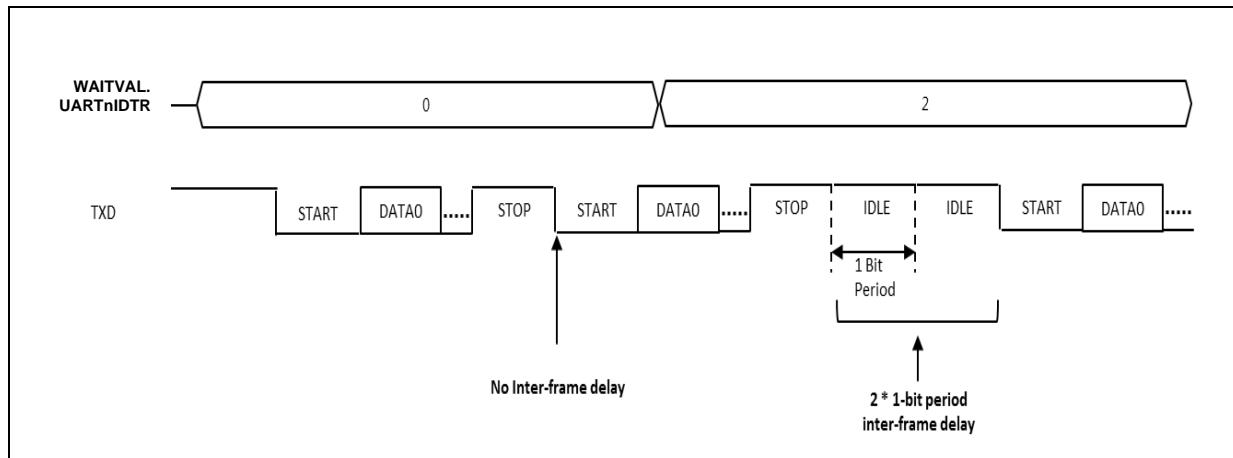

The example of transmission data format is introduced in Figure 86.

**Figure 86. Transmission Data Format Example**

### 15.4.3 Inter-frame delay transmission

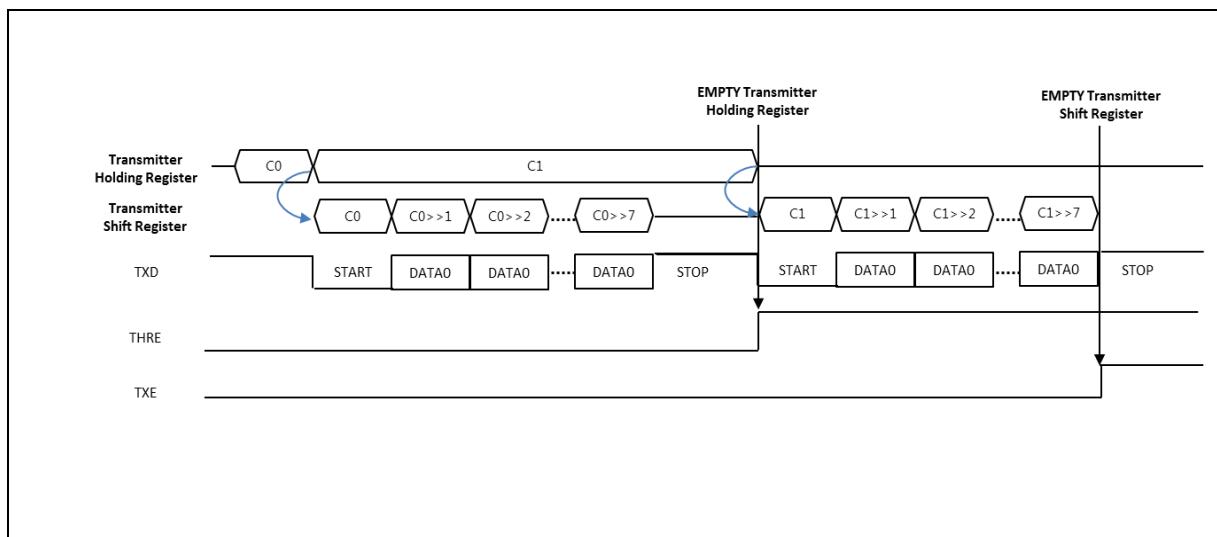

The inter-frame delay function allows the transmitter to insert an idle state on the TXD line between 2 characters. The width of the idle state is defined in WAITVAL field of the UARTn\_IDTR register. When this field is set as 0, no time-delay is generated. Otherwise, the transmitter holds a high level on TXD after each transmitted character during the number of bit periods defined in WAITVAL field.

**Figure 87. Inter-frame Delay Timing Diagram**

### 15.4.4 Transmit interrupt

The transmission operation makes some kind of interrupt flags. When transmitter hold register is empty, the THRE interrupt flag will be raised. When transmitter shifter register is empty, the TXE interrupt flag will be raised. User can select an interrupt timing that works the best for the application.

**Figure 88. Transmit Interrupt Timing Diagram**

## 16 I2C 0/1/2 interface

I2C is one of industrial standard serial communication protocols, which uses 2 bus lines, Serial Data Line (SDAn) and a Serial Clock Line (SCLn), to exchange data. Because both SDAn and SCLn lines are open-drain output, each line needs a pull-up resistor ( $n = 0, 1$  and  $2$ ).

The I2C 0/1/2 of A31G12x series features the followings:

- Compatible with I2C bus standard
- Multi-master operation
- Up to 1MHz data transfer read speed
- 7-bit address
- Support two slave addresses
- Both master and slave operation
- Bus busy detection

## 16.1 I2C 0/1/2 block diagram

Figure 89 shows a block diagram of the I2C block.

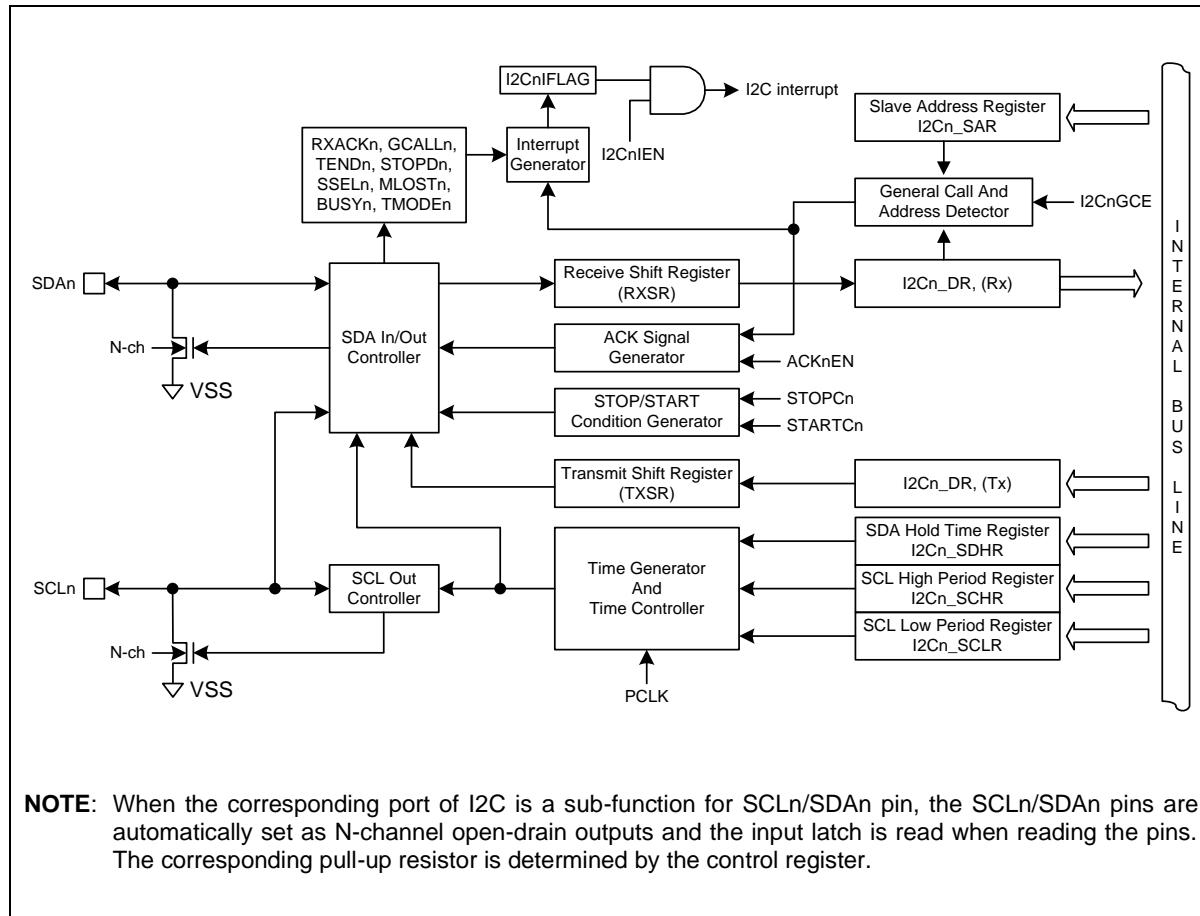

Figure 89. I2C Block Diagram (n = 0, 1 and 2)

## 16.2 Pin description for I2C 0/1/2

Table 67. Pins and External Signals for I2C (n = 0, 1 and 2)

PIN NAME	TYPE	DESCRIPTION
SCL <sub>n</sub>	I/O	I2C channel n Serial clock bus line (open-drain)
SDA <sub>n</sub>	I/O	I2C channel n Serial data bus line (open-drain)

### 16.3 Registers

Base address and register map of the I2C 0/1/2 are shown in Table 68 and Table 69.

**Table 68. Base Address of I2C Interface**

Name	Base address	Size	Description

7	I2CnEN	Activate I2Cn Block. 0 Disable I2Cn block. 1 Enable I2Cn block.
6	TXDLYENBn	I2Cn_SDHR Register Control. 0 Enable I2Cn_SDHR register. 1 Disable I2Cn_SDHR register.
5	I2CnIEN	I2Cn Interrupt Enable. 0 Disable I2Cn interrupt. 1 Enable I2Cn interrupt.
4	I2CnFLAG	I2Cn Interrupt Flag. This bit is cleared when all interrupt source bits in the I2Cn_ST register are cleared to '0'. 0 No request occurred. 1 Request occurred.
3	ACKnEN	Controls ACK signal generation at ninth SCL period. 0 No ACK signal is generated. (SDA = 1) 1 ACK signal is generated. (SDA = 0)
<b>NOTES:</b> ACK signal is output (SDA = 0) for the following 3 cases.		
— When received address packet is equal to SLAn[6:0] bits in I2Cn_SAR1/I2Cn_SAR2 register.		
— When received address packet is equal to value 0x00 with GCALLn enabled.		
— When I2Cn operates as a receiver (master or slave)		
2	IMASTERn	Represents Operation Mode of I2Cn. This bit is cleared to '0' on STOP condition. 0 I2Cn is in slave mode. 1 I2Cn is in master mode.
1	STOPCn	STOP Condition Generation When I2Cn is master. 0 No effect. 1 Generate STOP condition.
0	STARTCn	START Condition Generation When I2Cn is master. 0 No effect. 1 Generate START or Repeated START condition.

### 16.3.2 I2Cn\_ST: I2Cn status register

I2Cn\_ST register is 32-bit size and accessible in 32/16/8-bit. (n = 0, 1 and 2)

I2C0\_ST=0x4000\_4804, I2C1\_ST=0x4000\_4904, I2C2\_ST=0x4000\_4A04

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0									
Reserved																									GCALLn		TENDn		STOPDn		SSELn		MLOSTn		BUSYn		TMODEn		RXACKn	
0x000000																									RW		RW		RW		RW		RW		RW		RO		RW	

7	GCALLn	This bit has different meaning depending on whether I2C is master or slave. When I2C is a master, this bit represents whether it received AACK (address ACK) from slave.
0	No AACK is received. (Master mode)	
1	AACK is received (Master mode). It may be set to '1' after address transmission.	
	When I2C is a slave, this bit is used to indicate general call.	
0	General call address is not detected. (Slave mode)	
1	General call address is detected. (Slave mode)	
6	TENDn	This bit is set when 1-byte of data is transferred completely.
0	1 byte of data is not completely transferred.	
1	1 byte of data is completely transferred.	
5	STOPDn	This bit is set when a STOP condition is detected.
0	A STOP condition is not detected.	
1	A STOP condition is detected.	
4	SSELn	This bit is set when I2C is addressed by other master.
0	I2C is not selected as a slave.	
1	I2C is addressed by other master and acts as a slave.	
3	MLOSTn	This bit represents the result of bus arbitration in master mode.
0	I2C maintains bus mastership.	
1	I2C has lost bus mastership during arbitration process.	
2	BUSYn	This bit reflects bus status.
0	I2C bus is idle, so a master can issue a START condition.	
1	I2C bus is busy.	
1	TMODEn	This bit is used to indicate whether I2C is transmitter or receiver.
0	I2C is a receiver.	
1	I2C is a transmitter.	
0	RXACKn	This bit shows the state of ACK signal.
0	No ACK is received.	
1	ACK is received at ninth SCL period.	

#### NOTES:

1. The GCALLn, TENDn, STOPDn, SSELn, and MLOSTn bits can be source of interrupt.
2. When an I2C interrupt occurs except for deep sleep mode, the SCL line is held low. To release SCL, Clear to "0b" all interrupt source bits in I2Cn\_ST register.
3. The GCALLn, TENDn, STOPDn, SSELn, MLOSTn, and RXACKn bits are cleared when '1' is written to the corresponding bit.

### 16.3.3 I2Cn\_SAR1: I2Cn slave address register 1

I2Cn\_SAR1 register is 32-bit size and accessible in 32/16/8-bit. (n = 0, 1 and 2)

I2C0\_SAR1=0x4000\_4808, I2C1\_SAR1=0x4000\_4908, I2C2\_SAR1=0x4000\_4A08

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved																									SLAn		GCALLnEN				
0x000000																									0000000		RW				
-																									-		0				

7	SLAn	These bits configure the slave address 1 in slave mode.
1		
0	GCALLnEN	This bit decides whether I2Cn allows general call address or not in I2Cn slave mode.
0		Ignore general call address.
1		Allow general call address.

### 16.3.4 I2Cn\_SAR2: I2Cn slave address register 2

I2Cn\_SAR2 register is 32-bit size and accessible in 32/16/8-bit. (n = 0, 1 and 2)

I2C0\_SAR2=0x4000\_480C, I2C1\_SAR2=0x4000\_490C, I2C2\_SAR2=0x4000\_4A0C

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved																									SLAn		GCALLnEN

7	SLAn	These bits configure the slave address 2 in slave mode.
1		
0	GCALLnEN	This bit decides whether I2Cn allows general call address or not in I2Cn slave mode.
0		Ignore general call address.
1		Allow general call address.

### 16.3.5 I2Cn\_DR: I2Cn data register

I2Cn\_DR register is 32-bit size and accessible in 32/16/8-bit. (n = 0, 1 and 2)

I2C0\_DR=0x4000\_4810, I2C1\_DR=0x4000\_4910, I2C2\_DR=0x4000\_4A10

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved														DATA																	
0x000000														0x00														RW			

7 DATA The I2Cn\_DR Transmit buffer and Receive buffer share the same I/O address with this DATA register.  
 0 The Transmit Data Buffer is the destination for data written to the I2Cn\_DR register.  
 Reading the I2Cn\_DR register returns the contents of the Receive Buffer.

### 16.3.6 I2Cn\_SDHR: I2Cn SDA hold time register

I2Cn\_SDHR register is 32-bit size and accessible in 32/16/8-bit. (n = 0, 1 and 2)

I2C0\_SDHR=0x4000\_4814, I2C1\_SDHR=0x4000\_4914, I2C2\_SDHR=0x4000\_4A14

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved														HLDT																	
0x000000														0x001														RW			

11 HLDT This register is used to control SDA output timing from the falling edge of SCL.  
 0 Note that SDA is changed after tPCLK X (I2Cn\_SDHR+2). In master mode, load half the value of I2Cn\_SCLR to this register to make SDA switch in the middle of SCL.  
 In slave mode, configure this register regarding the frequency of SCL from master.  
 The SDA is changed after tPCLK X (I2Cn\_SDHR+2) in master mode.  
 So, to ensure proper operation in slave mode, the value tPCLK X (I2Cn\_SDHR + 2) must be smaller than the period of SCL.

### 16.3.7 I2Cn\_SCLR: I2Cn SCL low period register

I2Cn\_SCLR register is 32-bit size and accessible in 32/16/8-bit. (n = 0, 1 and 2)

I2C0\_SCLR=0x4000\_4818, I2C1\_SCLR=0x4000\_4918, I2C2\_SCLR=0x4000\_4A18

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved															SCLL																
0x00000															0x03F														RW		
-																															

---

11	SCLL	This register defines the low period of SCL in master mode. The base clock is PCLK
0		and the period is calculated by the formula: tPCLK X (4 X I2Cn_SCLR + 2) where tPCLK is the period of PCLK.

---

### 16.3.8 I2Cn\_SCHR: I2Cn SCL high period register

I2Cn\_SCHR register is 32-bit size and accessible in 32/16/8-bit. (n = 0, 1 and 2)

I2C0\_SCHR=0x4000\_481C, I2C1\_SCHR=0x4000\_491C, I2C2\_SCHR=0x4000\_4A1C

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved															SCLH														RW		
0x00000															0x03F														RW		
-																															

---

11	SCLH	This register defines the high period of SCL in master mode.
0		The base clock is PCLK and the period is calculated by the formula: tPCLK X (4 X I2Cn_SCHR + 2) where tPCLK is the period of PCLK.

---

## 16.4 Functional description

### 16.4.1 I2C bit transfer

The data on the SDAn line must be stable during HIGH period of the clock, SCLn. The HIGH or LOW state of the data line can only change when the clock signal on the SCLn line is LOW. The exceptions are START(S), repeated START(Sr), and STOP(P) condition, where data line changes when clock line is high.

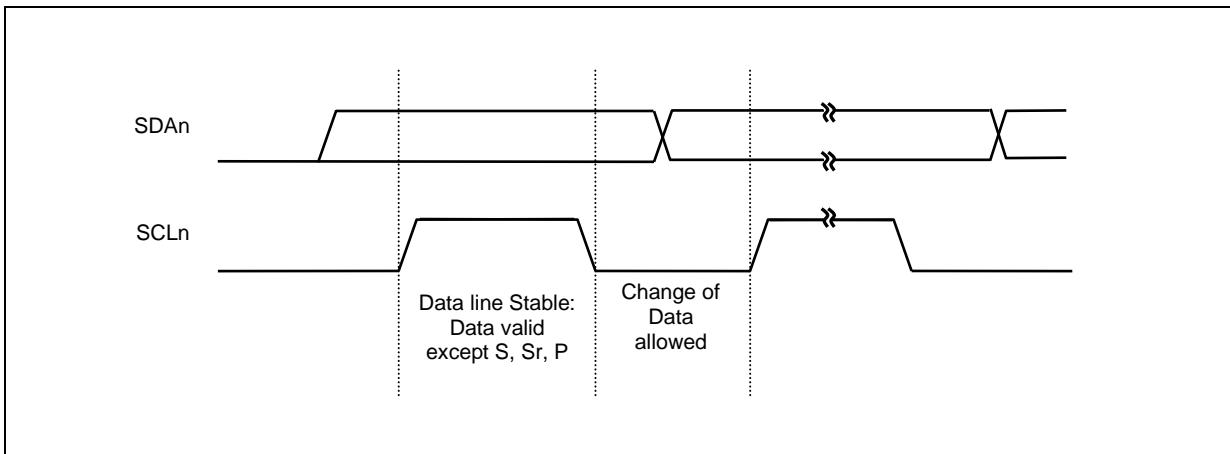

Figure 90. I2C Bus bit transfer ( $n = 0, 1$  and  $2$ )

### 16.4.2 START/Repeated START/STOP

One master can issue a START (S) condition to detect other devices connected to the SCLn, SDAn lines that will use the bus. A STOP (P) condition is generated by the master to release the bus lines so that other devices can use it.

A high to low transition on the SDAn line while SCLn is high defines a START (S) condition.

A low to high transition on the SDAn line while SCLn is high defines a STOP (P) condition.

START and STOP conditions are always generated by the master. The bus is considered to be busy after START condition. The bus is considered to be free again after STOP condition, i.e., the bus is busy between START and STOP condition. If a repeated START condition (Sr) is generated instead of STOP condition, the bus stays in busy mode. So, the START and repeated START conditions are functionally identical.

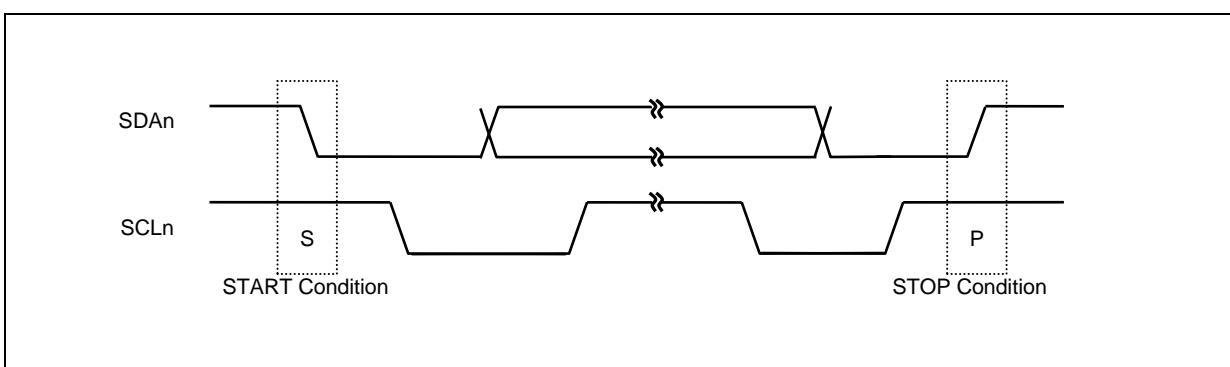

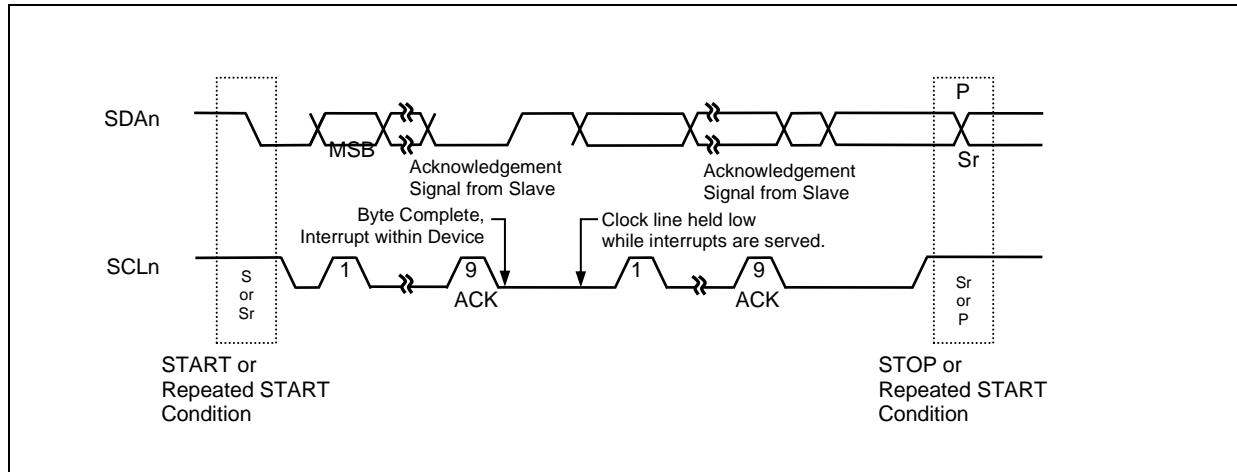

Figure 91. START and STOP condition ( $n = 0, 1$  and  $2$ )

### 16.4.3 Data transfer

Every byte on the SDAn line must be 8-bits long, but the number of bytes that can be transmitted per transfer is unlimited. Each byte has to be followed by an acknowledge bit. Data is transferred with the most significant bit (MSB) first. If a slave cannot receive or transmit another complete byte of data until it has performed some other function, it can hold the clock line SCLn LOW to force the master

into a wait state. Data transfer then continues when the slave is ready for another byte of data and releases clock line SCLn.

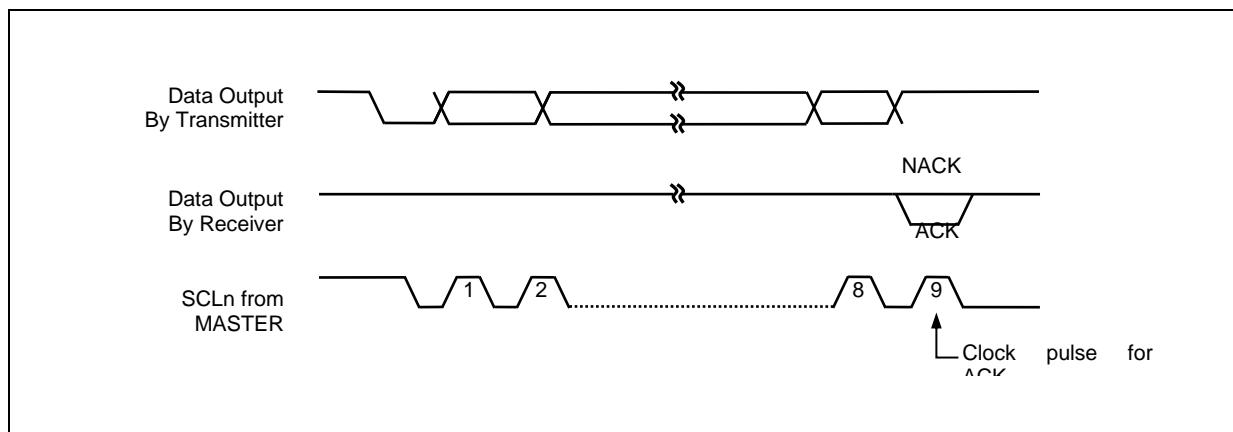

**Figure 92. I2C Bus data transfer (n = 0, 1 and 2)**

#### 16.4.4 Acknowledge

An acknowledge clock pulse is generated by the master. The transmitter releases the SDA<sub>n</sub> line (HIGH) during the acknowledge clock pulse. The receiver must pull down the SDA<sub>n</sub> line during the acknowledge clock pulse so that it remains stable at LOW during the HIGH period of this clock pulse. When a slave is addressed by a master (Address Packet), and if it is unable to receive or transmit because it is performing some real time function, the data line must be left HIGH by the slave. In addition, when a slave addressed by a master is unable to receive more data bits, the slave receiver must release the SDA<sub>n</sub> line (Data Packet). The master can then generate either a STOP condition to abort the transfer, or a repeated START condition to start a new transfer.

If a master receiver is involved in a transfer, it must signal the end of data to the slave transmitter by not generating an acknowledge on the last byte that was clocked out of the slave. The slave transmitter must release the data line to allow the master to generate a STOP or repeated START condition.

**Figure 93. I2C bus acknowledge (n = 0, 1 and 2)**

#### 16.4.5 Synchronization/ Arbitration

Clock synchronization is performed using the wired-AND connection of I2C interfaces to the SCL<sub>n</sub> line. This means that a HIGH to LOW transition on the SCL<sub>n</sub> line will cause the devices concerned to start counting off their LOW period and it will hold the SCL<sub>n</sub> line in that state until the clock HIGH state is reached. However the LOW to HIGH transition of this clock may not change the state of the SCL<sub>n</sub> line if another clock is still within its LOW period. In this way, a synchronized SCL<sub>n</sub> clock is generated with its LOW period determined by the device with the longest clock LOW period, and its HIGH period determined by the one with the shortest clock HIGH period.

A master may start a transfer only if the bus is free. Two or more masters may generate a START condition. Arbitration takes place on the SDAn line, while the SCL<sub>n</sub> line is at the HIGH level, in such a way that a master that transmits a HIGH level, while another master that transmits a LOW level, will switch off its DATA output state because the level on the bus does not correspond to its own level. Arbitration continues for many bits until a winning master gets the ownership of I2C bus. Its first stage is comparison of the address bits.

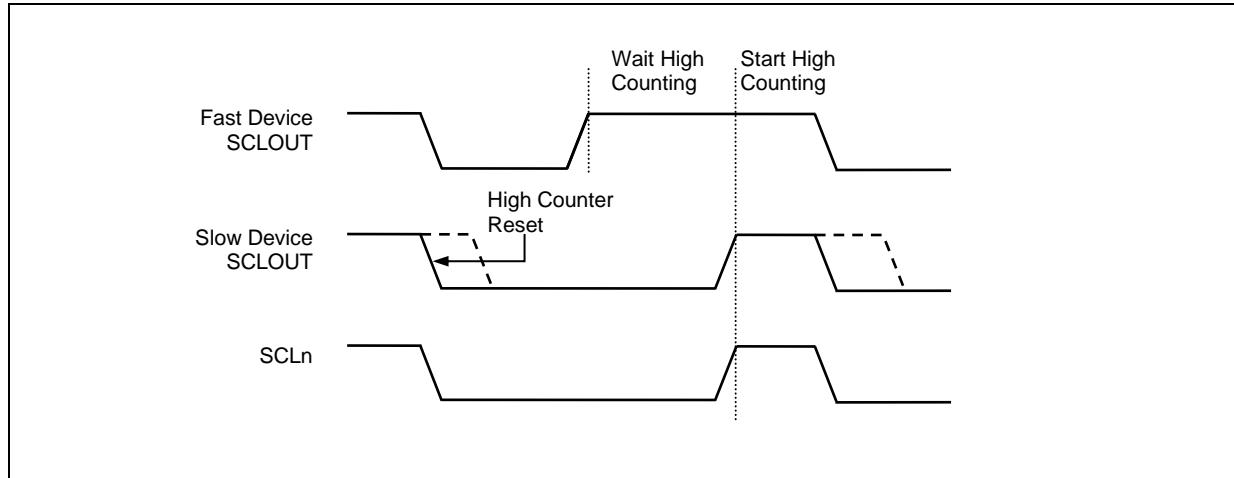

Figure 94. Clock synchronization during the arbitration procedure ( $n = 0, 1$  and  $2$ )

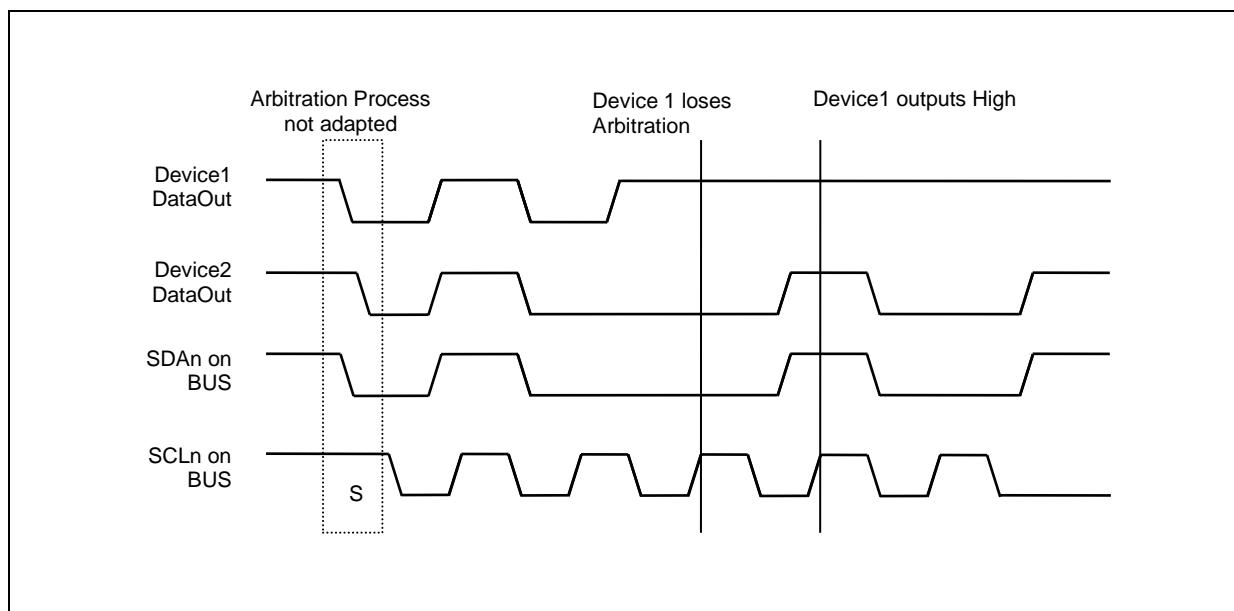

Figure 95. Arbitration procedure between two masters ( $n = 0, 1$  and  $2$ )

## 16.5 I2C operation

The I2C is byte-oriented and interrupt-based. Interrupts are issued after all bus events except for the transmission of a START condition. Since I2C is interrupt based, the application software is free to carry on with other operations during an I2C byte transfer.

Note that when an I2C interrupt is generated, I2CnIFLAG flag in I2Cn\_CR register is set, and it is cleared when all interrupt source bits in the I2Cn\_ST register are cleared to '0'. When I2C interrupt occurs, the SCLn line is held at LOW until all interrupt source bits in I2Cn\_ST register are cleared to '0'. When the I2CnIFLAG flag is set, the I2Cn\_ST contains a value indicating the current state of the I2C bus. According to the value in I2Cn\_ST, software can decide what to do next.

I2C can operate in 4 modes: master/slave, transmitter/receiver. The operating mode is configured by a winning master. A more detailed explanation follows below. (n = 0, 1 and 2)

### 16.5.1 Master transmitter

To operate I2C as a master transmitter, follow the recommended steps below.

1. Enable I2C by setting I2CnEN bit in I2Cn\_CR. This provides main clock to the peripheral.
2. Load SLA+W into the I2Cn\_DR, where SLA is the address of slave device and W is the transfer direction from the viewpoint of master. For master transmitter, W is '0'. Note that I2Cn\_DR is used for both address and data.
3. Configure baud rate by writing desired value to both I2Cn\_SCLR and I2Cn\_SCHR for the Low and High period of SCLn line.
4. Configure the I2Cn\_SDHR to decide when SDAn changes value from falling edge of SCLn. If SDA should change in the middle of SCLn LOW period, load half the value of I2Cn\_SCLR to the I2Cn\_SDHR.
5. Set the STARTCn bit in I2Cn\_CR. This transmits a START condition. Also, configure how to handle interrupt and ACK signal. When the STARTCn bit is set, 8-bit data in I2Cn\_DR is transmitted out according to the baud-rate.
6. This is ACK signal processing stage for address packet transmitted by master. When 7-bit address and 1-bit transfer direction is transmitted to target slave device, the master can know whether the slave acknowledged or not in the 9th high period of SCLn. If the master gains bus mastership, I2C generates GCALL interrupt regardless of receiving ACK from the slave device. When I2C loses bus mastership during arbitration process, the MLOSTn bit in I2Cn\_ST is set, and I2C waits in idle state or can be operated as an addressed slave.

To operate as a slave when the MLOSTn bit in I2Cn\_ST is set, the ACKnEN bit in I2Cn\_CR must be set and the received 7-bit address must match the SLAn bits in I2Cn\_SAR1/2. In this case, I2C operates as a slave transmitter or a slave receiver (go to appropriate section). In this stage, I2C holds the SCLn LOW. The reason for this is to decide whether I2C should continue serial transfer or stop communication. The following steps continue, assuming that I2C does not lose mastership during the first data transfer.

I2C (Master) can choose one of the following cases regardless of receiving ACK signal from slave.

- A. Master receives ACK signal from slave, so continues data transfer since slave can receive more data from master. In this case, load data to transmit to I2Cn\_DR.
- B. Master stops data transfer even if it receives ACK signal from slave. In this case, set the STOPC bit in I2Cn\_CR.
- C. Master transmits repeated START condition without checking ACK signal. In this case, load SLA+R/W into the I2Cn\_DR and set STARTCn bit in I2Cn\_CR.

After doing any of the actions above, clear all interrupt source bits in I2Cn\_ST to '0' to release SCLn line. In case of A, move to step 7. In case of B, move to step 9 to handle STOP interrupt. In case of C, move to step 6 after transmitting the data in I2Cn\_DR, and if transfer direction bit is '1', go to master receiver section.

7. 1-Byte of data is transmitted. During data transfer, bus arbitration continues.
8. This is ACK signal processing stage for data packet transmitted by master. I2C holds the SCLn LOW. When I2C loses bus mastership while transmitting data to arbitrate other masters, the MLOSTn bit in I2Cn\_ST is set. If then, I2C waits in idle state. When the data in I2Cn\_DR is transmitted completely, I2C generates TENDn interrupt.

I2C can choose one of the following cases regardless of receiving ACK signal from slave.

- A. Master receives ACK signal from slave, so continues data transfer since slave can receive more data from master. In this case, load data to transmit to I2Cn\_DR.
- B. Master stops data transfer even if it receives ACK signal from slave. In this case, set the STOPCn bit in I2Cn\_CR.
- C. Master transmits repeated START condition without checking ACK signal. In this case, load SLA+R/W into the I2Cn\_DR and set the STARTCn bit in I2Cn\_CR.

After doing any of the actions above, clear all interrupt source bits in I2Cn\_ST to '0' to release SCL line. In case of A, move to step 7. In case of B, move to step 9 to handle STOP interrupt. In case of C, move to step 6 after transmitting the data in I2CDR, and if transfer direction bit is '1', go to master receiver section.

9. This is the final step for master transmitter function of I2C, handling STOP interrupt. The STOP bit indicates that data transfer between master and slave is over. To clear I2Cn\_ST, write "0xff" to I2Cn\_ST. After this, I2C enters idle state.

### 16.5.2 Master receiver

To operate I2C in master receiver, follow the recommended steps below.

1. Enable I2C by setting I2CnEN bit in I2Cn\_CR. This provides main clock to the peripheral.
2. Load SLA+R into the I2Cn\_DR, where SLA is address of slave device and R is transfer direction from the viewpoint of the master. For master receiver, R is '1'. Note that I2Cn\_DR is used for both address and data.
3. Configure baud rate by writing desired value to both I2Cn\_SCLR and I2Cn\_SCHR for the Low and High period of SCLn line.
4. Configure the I2Cn\_SDHR to decide when SDAn changes value from falling edge of SCLn. If SDAn should change in the middle of SCLn LOW period, load half the value of I2Cn\_SCLR to the I2Cn\_SDHR.
5. Set the STARTCn bit in I2Cn\_CR. This transmits a START condition. Also, configure how to handle interrupt and ACK signal. When the STARTCn bit is set, 8-bit data in I2Cn\_DR is transmitted out according to the baud-rate.
6. This is ACK signal processing stage for address packet transmitted by master. When 7-bit address and 1-bit transfer direction is transmitted to target slave device, the master can know whether the slave acknowledged or not in the 9th high period of SCLn. If the master gains bus mastership, I2C generates GCALL interrupt regardless of receiving ACK from the slave device. When I2C loses bus mastership during arbitration process, the MLOSTn bit in I2Cn\_ST is set, and I2C waits in idle state or can be operated as an addressed slave.

To operate as a slave when the MLOSTn bit in I2Cn\_ST is set, the ACKnEN bit in I2Cn\_CR must be set, and the received 7-bit address must equal to the SLAn bits in I2Cn\_SAR1/2. In this case, I2C operates as a slave transmitter or a slave receiver (go to appropriate section). In this stage, I2C holds the SCLn LOW. The reason for this is to decide whether I2C should

continue serial transfer or stop communication. The following steps continue, assuming that I2C does not lose mastership during the first data transfer.

I2C (Master) can choose one of the following cases according to the reception of ACK signal from slave.

- A. Master receives ACK signal from slave, so continues data transfer since slave can prepare and transmit more data to master. Configure ACKnEN bit in I2Cn\_CR to decide whether I2C should Acknowledges the next data to be received or not.
- B. Master stops data transfer since it receives no ACK signal from slave. In this case, set the STOPCn bit in I2Cn\_CR.
- C. Master transmits repeated START condition due to lack of ACK signal from slave. In this case, load SLA+R/W into the I2Cn\_DR and set STARTCn bit in I2Cn\_CR.

After doing any of the actions above, clear all interrupt source bits in I2Cn\_ST to '0' to release SCLn line. In case of A, move to step 7. In case of B, move to step 9 to handle STOP interrupt. In case of C, move to step 6 after transmitting the data in I2Cn\_DR, and if transfer direction bit is '0', go to master transmitter section.

7. 1-Byte of data is received.
8. This is ACK signal processing stage for data packet transmitted by slave. I2C holds the SCLn LOW. When 1-Byte of data is received completely, I2C generates TENDn interrupt.

I2C can choose one of the following cases according to the RXACKn flag in I2Cn\_ST.

- A. Master continues receiving data from slave. To do this, set ACKnEN bit in I2Cn\_CR to acknowledge the next data to be received.
- B. Master wants to terminate data transfer when it receives next data by not generating ACK signal. This can be done by clearing ACKnEN bit in I2Cn\_CR.
- C. Since no ACK signal is detected, master terminates data transfer. In this case, set the STOPCn bit in I2Cn\_CR.
- D. No ACK signal is detected, and master transmits repeated START condition. In this case, load SLA+R/W into the I2Cn\_DR and set the STARTCn bit in I2Cn\_CR.

After doing any of the actions above, clear all interrupt source bits in I2Cn\_ST to '0' to release SCLn line. In case of A and B, move to step 7. In case of C, move to step 9 to handle STOP interrupt. In case of D, move to step 6 after transmitting the data in I2Cn\_DR, and if transfer direction bit is '0', go to master transmitter section.

9. This is the final step for master receiver function of I2C, handling STOP interrupt. The STOP bit indicates that data transfer between master and slave is over. To clear I2Cn\_ST, write "0xff" value to I2Cn\_ST. After this, I2C enters idle state.

### 16.5.3 Slave transmitter

To operate I2C in slave transmitter, follow the recommended steps below.

1. If the operating clock (HCLK) of the system is slower than that of SCLn, load value 0x00 into I2Cn\_SDHR to make SDAn change within one system clock period from the falling edge of SCLn. Note that the hold time of SDAn is calculated by SDAH x period of HCLK where SDAH is multiple of number of HCLK coming from I2Cn\_SDHR. When the hold time of SDAn is longer than the period of HCLK, I2C (slave) cannot transmit serial data properly.
2. Enable I2C by setting I2CnIEN bit and I2CnEN bit in I2Cn\_CR. This provides main clock to the peripheral.
3. When a START condition is detected, I2C receives one byte of data and compares it with SLAn bits in I2Cn\_SAR1/2. If the GCALLnEN bit in I2Cn\_SAR1/2 is enabled, I2C compares the received data with value 0x00, the general call address.
4. If the received address does not match SLAn bits in I2CnSAR, I2C enters idle state, i.e, waits for another START condition. Otherwise, if the address equals to SLAn bits and the ACKnEN bit is enabled, I2C generates SSELn interrupt and the SCLn line is held LOW. Note that even if the address matches SLAn bits, when the ACKnEN bit is disabled, I2C enters idle state. When SSELn interrupt occurs, load transmit data to I2Cn\_DR and clear all interrupt source bits in I2Cn\_ST to '0' to release SCLn line.
5. 1-Byte of data is transmitted.
6. In this step, I2C generates TENDn interrupt and holds the SCLn line LOW regardless of receiving ACK signal from master. Slave can select one of the following cases.
  - A. No ACK signal is detected and I2C waits STOP or repeated START condition.
  - B. ACK signal from master is detected. Load data to transmit into I2Cn\_DR.

After doing any of the actions above, clear all interrupt source bits in I2Cn\_ST to '0' to release SCLn line. In case of A, move to step 7 to terminate communication. In case of B, move to step 5. In either case, a repeated START condition can be detected. For that case, move step 4.
7. This is the final step for slave transmitter function of I2C, handling STOP interrupt. The STOPCn bit indicates that data transfer between master and slave is over. To clear I2Cn\_ST, write "0xff" to I2Cn\_ST. After this, I2C enters idle state.

#### 16.5.4 Slave receiver

To operate I2C in slave receiver, follow the recommended steps below.

1. If the operating clock (HCLK) of the system is slower than that of SCLn, load value 0x00 into I2Cn\_SDHR to make SDAn change within one system clock period from the falling edge of SCLn. Note that the hold time of SDAn is calculated by SDAH x period of HCLK where SDAH is multiple of number of HCLK coming from I2Cn\_SDHR. When the hold time of SDAn is longer than the period of HCLK, I2C (slave) cannot transmit serial data properly.
2. Enable I2C by setting I2CnIEN bit in I2Cn\_CR. This provides main clock to the peripheral.
3. When a START condition is detected, I2C receives one byte of data and compares it with SLA bits in I2CSAR. If the GCALLnEN bit in I2Cn\_SAR1/2 is enabled, I2C compares the received data with value 0x00, the general call address.
4. If the received address does not match SLAn bits in I2Cn\_SAR1/2, I2C enters idle state i.e., waits for another START condition. Otherwise, if the address match SLAn bits and the ACKnEN bit is enabled, I2C generates SSELn interrupt and the SCLn line is held LOW. Note that even if the address equals to SLA bits, when the ACKnEN bit is disabled, I2C enters idle state. When SSELn interrupt occurs and I2C is ready to receive data, clear all interrupt source bits in I2Cn\_ST to '0' to release SCLn line.
5. 1-Byte of data is received.
6. In this step, I2C generates TENDn interrupt and holds the SCLn line LOW regardless of receiving ACK signal from master. Slave can select one of the following cases.
  - A. No ACK signal is detected (ACKnEN=0) and I2C waits STOP or repeated START condition.
  - B. ACK signal is detected (ACKnEN=1) and I2C can continue to receive data from master.

After doing any of the actions above, clear all interrupt source bits in I2Cn\_ST to '0' to release SCLn line. In case of A, move to step 7 to terminate communication. In case of B, move to step 5. In either case, a repeated START condition can be detected. For that case, move to step 4.
7. This is the final step for slave receiver function of I2C, handling STOP interrupt. The STOPCn bit indicates that data transfer between master and slave is over. To clear I2Cn\_ST, write "0xff" to I2Cn\_ST. After this, I2C enters idle state.

## 17 LCD driver

LCD driver of A31G12x series includes an LCD control register (LCD\_CR) and an LCD driver bias and contrast control register (LCD\_BCCR). LCLK[1:0] of the LCD\_CR determines frequency of COM signal scanning each segment output. A RESET clears the LCD\_CR and sets the LCD\_BCCR to logic '0'.

LCD display can continue its operation even during Sleep mode and Deep sleep mode if it uses a selected clock for LCD driver.

A clock and duty of the LCD driver is initialized by hardware whenever a value is written to the control register. So, it is recommended not to rewrite the LCD\_CR frequently.

### 17.1 LCD driver block diagram

Figure 96 shows a block diagram of the LCD driver block.

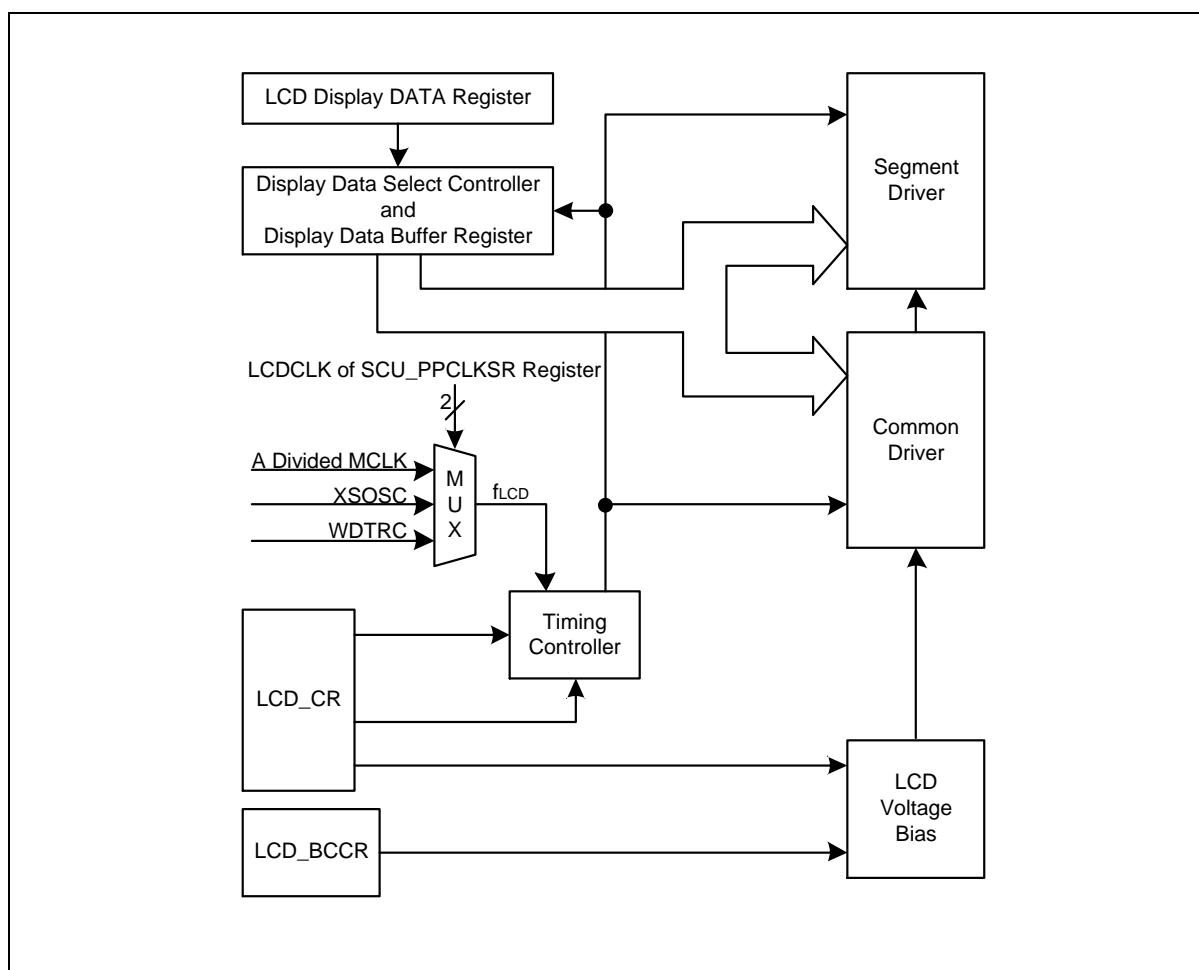

Figure 96. LCD Driver Block Diagram

## 17.2 Pin description for LCD driver

**Table 70. Pins and External Signals for LCD Driver**

PIN NAME	TYPE	DESCRIPTION
COM0 to COM7	O	LCD common signal outputs
SEG0 to SEG43	O	LCD segment signal outputs

### 17.3 Registers

Base address and register map of the LCD driver are shown in Table 71 and Table 72.

**Table 71. Base Address of LCD Driver**

Name	Base address
LCD	0x4000_5000

**Table 72. LCD Driver Register Map**

Name	Offset	Type	Description	Reset Value
LCD_CR	0x0000	RW	LCD driver control register	0x00000000

## 17.4 LCD display RAM organization

Display data are stored in display data area. The display data stored to the display data area (address 0x4000\_5010-0x4000\_503B) are read automatically and are sent to the LCD driver by hardware. The LCD driver generates the segment and common signals in accordance to the display data and driving method. Therefore, display patterns can be changed by simply overwriting the contents of the display data area with a program.

Figure 97 shows the correspondence between the display data area and the COM/SEG pins. The LCD is turned on when the display data is '1' and turned off when it is '0'.

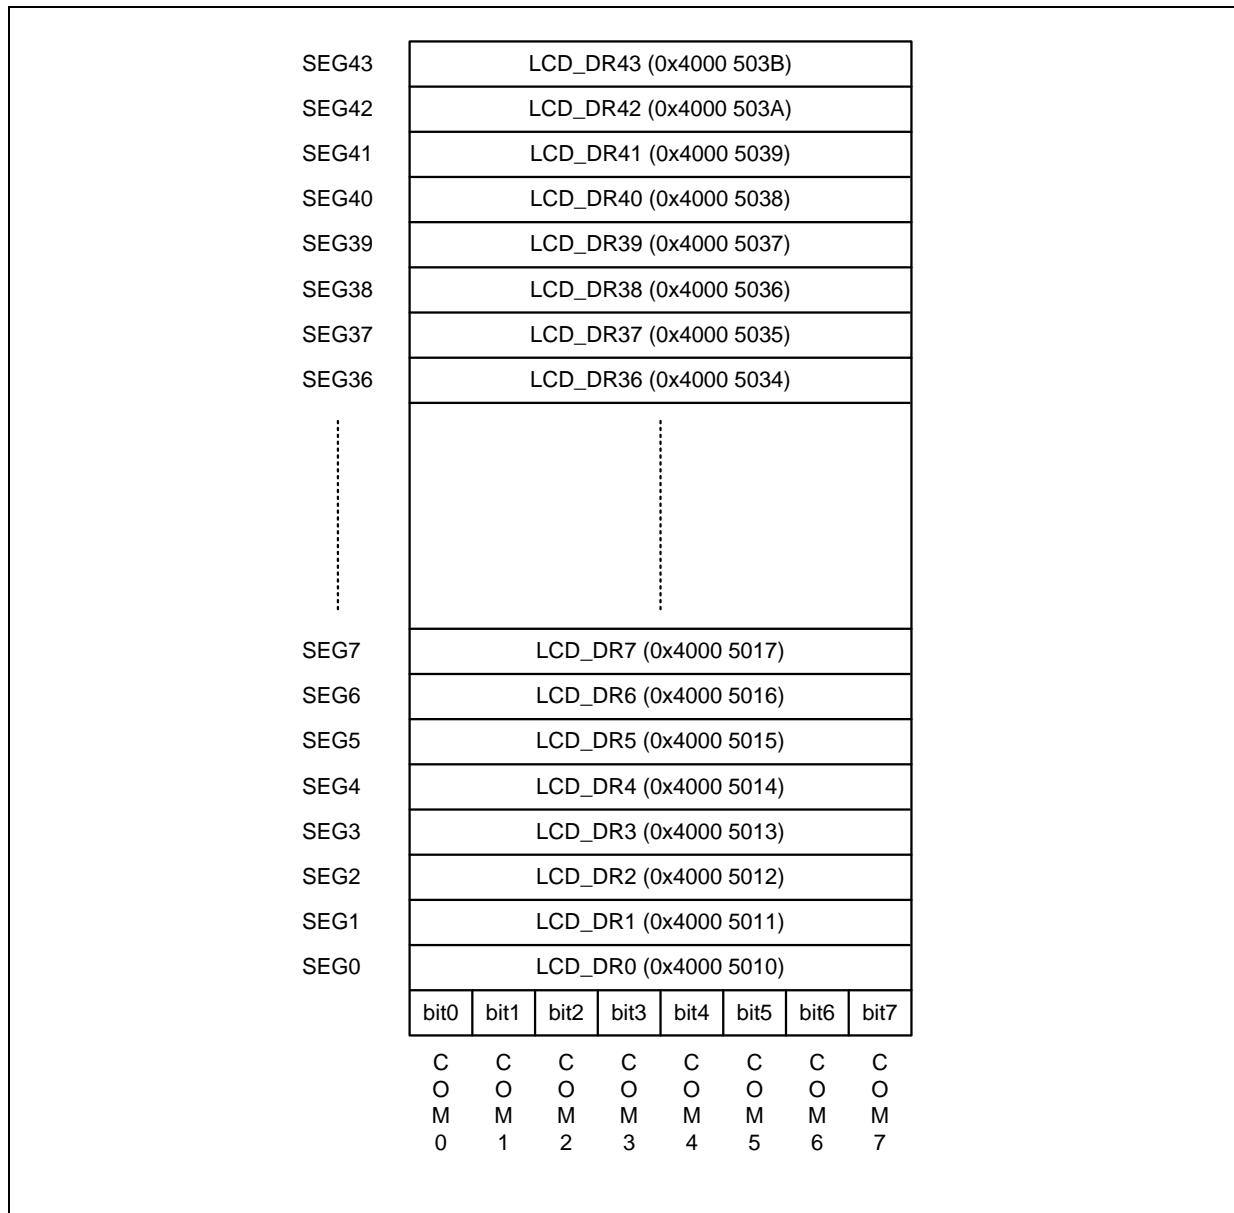

Figure 97. LCD Display RAM Organization

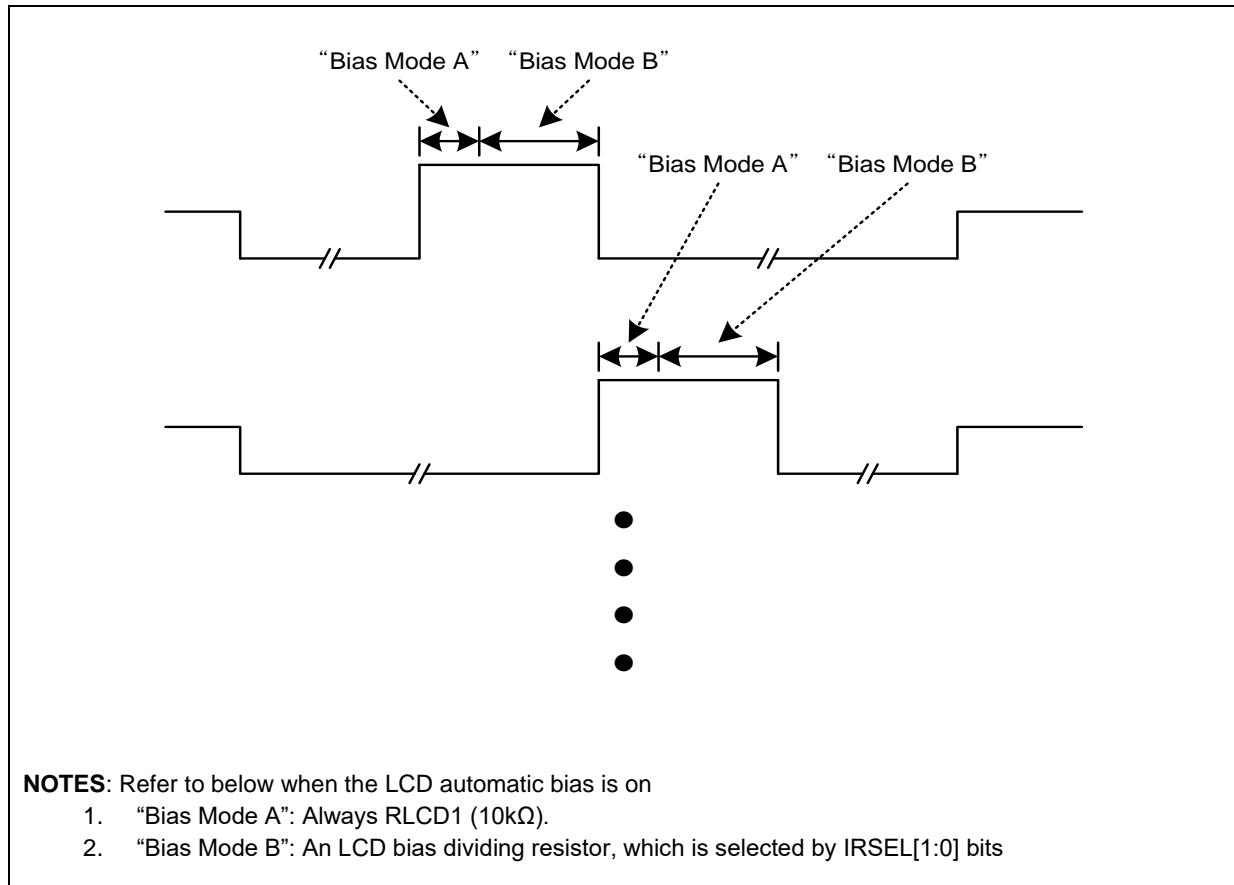

Figure 102. LCD Automatic Bias Control Timing Diagram

## 18 CRC and checksum

A CRC (cyclic redundancy check) generator is used to obtain 16-bit CRC code of Flash ROM and any data stream.

Among other applications, CRC-based techniques are used to verify data transmission or storage integrity. In the scope of functional safety standards, they offer means of verifying Flash memory's integrity.

The CRC generator helps computing the signature of the software during runtime, comparing with a reference signature.

A CRC generator of A31G12x series has following features:

- Auto CRC and User CRC Mode
- Supports CRC-CCITT ( $G_1(x) = x^{16} + x^{12} + x^5 + 1$ )
- Supports CRC-16 ( $G_2(x) = x^{16} + x^{15} + x^2 + 1$ )
- CRC and Checksum mode
- CRC/Checksum Start Address Auto Increment (User mode only)

## 18.1 CRC and checksum block diagram

Figure 103 shows a block diagram of the CRC and checksum interface block.

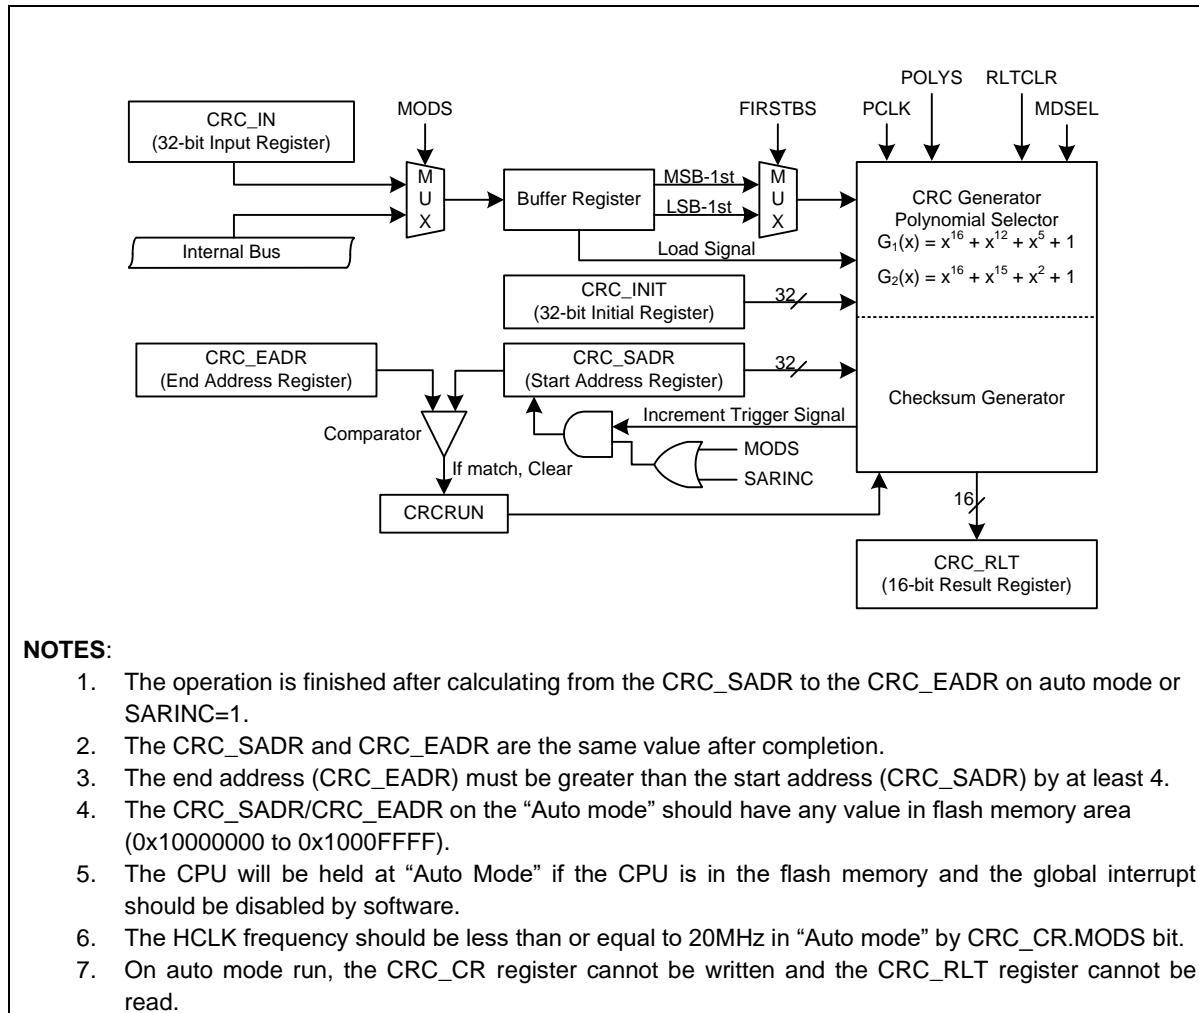

Figure 103. CRC and Checksum Block Diagram

## 18.2 Registers

Base address and register map of the CRC and checksum block are shown in Table 73 and Table 74.

**Table 73. Base Address of CRC**

Name	Base address
CRC	0x3000_1000

**Table 74. CRC Register Map**

Name	Offset	Type	Description	Reset Value
CRC_CR	0x0000	RW	CRC/Checksum Control Register	0x00000000
CRC_IN	0x0004	RW	CRC/Checksum Input Data Register	0x00000000
CRC_RLT	0x0008	RO	CRC/Checksum Result Data Register	0x0000FFFF
CRC_INIT	0x000C	RW	CRC/Checksum Initial Data Register	0x00000000
CRC_SADR	0x0010	RW	CRC/Checksum Start Address Register	0x10000000
CRC_EADR	0x0014	RW	CRC/Checksum End Address Register	0x1000FFFC

### 18.2.1 CRC\_CR: CRC control register

CRC\_CR register is 32-bit size and accessible in 32/16/8-bit.

**CRC\_CR=0x3000\_1000**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0					
Reserved																									<b>MODS</b>	<b>RLTCLR</b>	<b>MDSEL</b>	<b>POLYS</b>	<b>SARINC</b>	<b>Reserved</b>	<b>FIRSTBBS</b>	<b>CRCRUN</b>				
0x0000000																																				
-																																				

7	MODS	User/Auto Mode Selection.
	0	User mode. (Calculate every data written to the CRC_IN register)
	1	Auto mode. (Calculate till CRC_SADR == CRC_EADR)
6	RLTCLR	CRC/Checksum Result Data Register (CRC_RLT) Initialization.
	0	No effect.
	1	Initialize the CRC_RLT register with the value of CRC_INIT (This bit is automatically cleared to '0' after operation)
5	MDSEL	CRC/Checksum Selection.
	0	Select CRC.
	1	Select checksum.
4	POLYS	Polynomial Selection. (CRC only)
	0	Select CRC-CCITT ( $G_1(x) = x^{16} + x^{12} + x^5 + 1$ )
	1	Select CRC-16 ( $G_2(x) = x^{16} + x^{15} + x^2 + 1$ )
3	SARINC	CRC/Checksum Start Address Auto Increment Control. (User mode only)
	0	No effect.
	1	The CRC/Checksum start address register is incremented by '4' every data written to the CRC_IN register.
1	FIRSTBBS	First Shifted-in Selection. (CRC only)
	0	MSB-1st.
	1	LSB-1st.
0	CRCRUN	CRC/Checksum Start Control and Busy.
	0	Not busy. The CRC operation can be finished by writing '0' to this bit while running.
	1	Start CRC operation. This bit is automatically cleared to '0' when

---

the value of CRC\_SADR register reaches the value of CRC\_EADR register.

NOTE) The 5 “NOP instruction” should be executed immediately after this bit becomes ‘1’.

---

**NOTES:**

1. The CRC\_RLT register and the CRC/Checksum block should be initialized by writing ‘1’ to the RLTCLEAR bit before a new CRC/Checksum calculation.
2. The CRCRUN bit should be set to ‘1’ last time after setting appropriate values to the registers.
3. On the user mode, it will be calculated every writing data to the CRC\_IN register during CRCRUN==1.
4. On the user mode with SARINC==0, the block is finished by writing ‘0’ to the CRCRUN bit.
5. It is prohibited writing any data to the CRC\_IN register during CRCRUN==0.
6. The checksum is calculated by byte unit.
  - Ex) On 0x34A7E991, CRC\_RLT = 0x34 + 0xA7 + 0xE9 + 0x91.
7. The 5 “NOP Instruction” should follow immediately after CRCRUN bit is set to ‘1’.

### 18.2.2            **CRC\_IN: CRC input data register**

CRC\_IN register is 32-bit size.

CRC_IN=0x3000_1004																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**NOTE:** The LSB 7-bit of the end address should be "0x00" on "Auto mode".

### 18.2.6 CRC\_EADR: CRC end address register

CRC\_EADR register is 32-bit size and accessible in 32/16/8-bit.

CRC_EADR=0x3000_1014																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EADR																Don't care															
0x1000FFFC																00															
RW																I															
31	2	EADR	CRC End Address.																												
1	0	-	Don't care.																												

**NOTE:** The LSB-7bits of the end address should be "0x7C" on "Auto mode".

## 18.3 Functional description

### 18.3.1 CRC polynomial structure

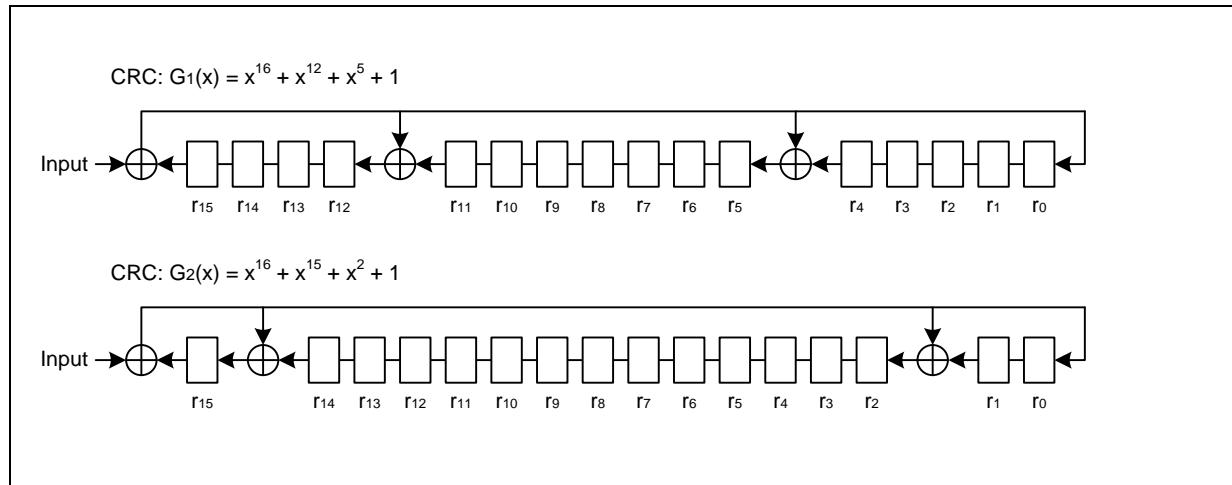

Figure 104. CRC Polynomial Structure

### 18.3.2 The CRC operation procedure in auto CRC/checksum mode

1. CRC/Checksum Clock Enable
2. Set CRC start address register. (CRC\_SADR)
3. Set CRC end address register. (CRC\_EADR)
4. Set CRC initial data register. (CRC\_INIT)
5. Global interrupt Disable.
6. Select CRC(HCLK) Clock. (HCLK should be less than or equal to 20MHz during CRC/Checksum auto mode)
7. Select Auto CRC/Checksum Mode and CRC.
8. CRC operation starts. (CRCRUN = 1)
9. Read the CRC result.
10. Global interrupt Enable.

### 18.3.3 The CRC operation procedure in user CRC/checksum mode

1. CRC/Checksum Clock Enable
2. Set CRC start address register. (CRC\_SADR)
3. Set CRC end address register. (CRC\_EADR)
4. Set CRC initial data register. (CRC\_INIT)
5. Select User CRC/Checksum Mode and CRC
6. CRC operation starts. (CRCRUN = 1)
7. Input CRC Data at CRC\_IN.
8. Check CRC is finished on Start Address Auto Increment or Compare Start address and End address in order to check CRC end point.
9. Repeat 8 and 9 until CRC end point.

10. CRC Stop and read CRC result.

## 19 Electrical characteristics

Unless otherwise specified, test conditions for DC characteristics are as shown in the followings:

- $T_A = -40^\circ\text{C}$  to  $+85^\circ\text{C}$ (Commercial grade) or  $T_A = -40^\circ\text{C}$  to  $+105^\circ\text{C}$ (Industrial grade)
- $VDD = 1.8$  to  $5.5\text{V}$

**NOTE:** Refer to Figure 126. A31G12x series Numbering Nomenclature for device part number by Commercial grade.

### 19.1 Absolute maximum ratings

Absolute maximum ratings are limiting values of operating and environmental conditions, which should not be exceeded under the worst possible conditions.

**Table 75. Absolute Maximum Ratings**

Parameter	Symbol	Ratings	Unit	Note
Supply voltage	VDD	-0.3 to +6.5	V	—
Normal pin	$V_I$	-0.3 to $VDD + 0.3$	V	Voltage on any pin with respect to VSS
	$V_o$	-0.3 to $VDD + 0.3$	V	
	$I_{OH}$	-18	mA	Maximum current output sourced by ( $I_{OH}$ per I/O pin)
	$\Sigma I_{OH}$	-150	mA	Maximum current ( $\Sigma I_{OH}$ )
	$I_{OL}$	140	mA	Maximum current sunk by ( $I_{OL}$ per I/O pin)
	$\Sigma I_{OL}$	170	mA	Maximum current ( $\Sigma I_{OL}$ )
Total power dissipation	$P_T$	850	mW	—
Storage temperature	$T_{STG}$	-65 to +150	°C	—

## 19.2 Recommended operating conditions

**Table 76. Recommended Operating Conditions**

Parameter	Symbol	Conditions			Min	Max	Units		
Operating voltage	VDD	fx = 32 to 38kHz	Sub Clock		1.8	5.5	V		
		fx = 2.0 to 4.2MHz	Main Clock	Ceramic	2.2	5.5			
		fx = 2.0 to 16MHz		Crystal	2.7	5.5			
		fx = 2.0 to 40MHz	External Clock		3.0	5.5			
		fx = 40kHz	Internal RC		1.8	5.5			
		fx = 2.5 to 40MHz			1.8	5.5			
Operating temperature	T <sub>OPR</sub>	VDD = 1.8 to 5.5V (Commercial grade)			-40	85	°C		
		VDD = 1.8 to 5.5V (Industrial grade)			-40	105			

### 19.3 ADC characteristics

**Table 77. ADC Characteristics**

(VDD = 2.2V to 5.5V)

Parameter	Symbol	Conditions		Min	Typ	Max	Units
Resolution	–	–	–	–	12	–	bit
Integral non-linearity	INL	AVREF=2.7V – 5.5V, $T_A = 25^\circ\text{C}$		–	–	$\pm 5$	LSB
Differential non-linearity	DNL			–	–	$\pm 1$	
Zero offset error	ZOE			–	–	$\pm 4$	
Full scale error	FSE			–	–	$\pm 8$	
Conversion time	$t_{\text{CONV}}$	AVREF=4.0V – 5.5V	20	–	–	–	$\mu\text{s}$
		AVREF=3.0V – 5.5V	30	–	–	–	
		AVREF=2.7V – 5.5V	60	–	–	–	
Analog input voltage	$V_{\text{AN}}$	–	VSS	–	AVREF	V	
Analog reference voltage	AVREF	–	2.2	–	VDD	V	
ADC input leakage current	$I_{\text{AN}}$	AVREF=5.0V	–	–	2	$\mu\text{A}$	
ADC current	$I_{\text{ADC}}$	Enable	VDD=5.0V	–	1	2	mA
		Disable		–	–	0.1	$\mu\text{A}$

**NOTES:**

1. Zero offset error is a difference between 0x000 and the converted output for zero input voltage (VSS).
2. Full scale error is a difference between 0xFFFF and the converted output for top input voltage (VDD).
3. If AVREF is less than 2.7V, the resolution degrades by 1-bit whenever AVREF drops 0.1V.  
(It is recommended that the clock of ADC is 0.5MHz under 2.7V)

## 19.4 Power-on reset characteristics

**Table 78. Power-on Reset Characteristics**

Parameter	Symbol	Conditions	Min	Typ	Max	Units
Reset release level	$V_{POR}$	—	—	1.2	—	V
Hysteresis	$\Delta V$	—	—	0.2	—	V
VDD voltage rising time	$t_R$	0.2V to 2.0V	0.05	—	100	V/ms
POR current	$I_{POR}$	—	—	0.1	—	$\mu A$

## 19.5 Low voltage reset characteristics

**Table 79. Low Voltage Reset Characteristics**

Parameter	Symbol	Conditions	Min	Typ	Max	Units	
Detection level	$V_{LVR}$	Falling edge voltage	-	1.62	1.77	V	
			1.85	2.00	2.15		
			1.98	2.13	2.28		
			2.13	2.28	2.43		
			2.31	2.46	2.61		
			2.47	2.67	2.87		
			2.84	3.04	3.24		
			3.00	3.20	3.40		
			3.35	3.55	3.75		
			3.45	3.75	4.05		
			3.69	3.99	4.29		
			3.95	4.25	4.55		
			4.25	4.55	4.85		
Hysteresis	$\Delta V$	-	-	100	200	mV	
Minimum pulse width	$t_{LW}$	-	100	-	-	$\mu s$	
LVR current	$I_{LVR}$	Enable, All mode	VDD = 5V	-	10.0	20.0	$\mu A$
		Disable		-	-	0.1	

## 19.6 Low voltage indicator characteristics

**Table 80. Low Voltage Indicator Characteristics**

Parameter	Symbol	Conditions	Min	Typ	Max	Units	
Detection level	$V_{LVI}$	Falling edge voltage	1.85	2.00	2.15	V	
			1.98	2.13	2.28		
			2.13	2.28	2.43		
			2.31	2.46	2.61		
			2.47	2.67	2.87		
			2.84	3.04	3.24		
			3.00	3.20	3.40		
			3.35	3.55	3.75		
			3.45	3.75	4.05		
			3.69	3.99	4.29		
			3.95	4.25	4.55		
			4.25	4.55	4.85		
Hysteresis	$\Delta V$	–	–	–	200	mV	
Minimum pulse width	$t_{LW}$	–	100	–	–	μs	
LVI current	$I_{LVI}$	Enable, All mode	VDD = 5V	–	10.0	20.0	μA
		Disable		–	–	0.1	

## 19.7 High frequency internal RC oscillator characteristics

**Table 81. High Frequency Internal RC Oscillator Characteristics**

Parameter	Symbol	Conditions	Min	Typ	Max	Units
Frequency	$f_{HIRC}$	VDD = 1.8V to 5.5V	–	40	–	MHz
Accuracy	–	$T_A = 0 \text{ }^{\circ}\text{C}$ to $+50 \text{ }^{\circ}\text{C}$	–	–	$\pm 1.5$	%
		$T_A = -40 \text{ }^{\circ}\text{C}$ to $+85 \text{ }^{\circ}\text{C}$ (Commercial grade)	–	–	$\pm 3.5$	
		$T_A = -40 \text{ }^{\circ}\text{C}$ to $+105 \text{ }^{\circ}\text{C}$ (Industrial grade)	–	–	$\pm 4.5$	
Clock duty ratio	$T_{OD}$	–	40	50	60	%
Stabilization time	$t_{HFS}$	–	–	–	100	$\mu\text{s}$
IRC current	$I_{HIRC}$	Enable	–	500	–	$\mu\text{A}$
		Disable	–	–	0.1	$\mu\text{A}$

## 19.8 Internal watchdog timer RC oscillator characteristics

**Table 82. Internal Watchdog Timer RC Oscillator Characteristics**

Parameter	Symbol	Conditions	Min	Typ	Max	Units
Frequency	$f_{WDTRC}$	—	36	40	44	kHz
Stabilization time	$t_{WDTS}$	—	—	—	1	ms
WDTRC current	$I_{WDTRC}$	Enable	—	3	6	$\mu\text{A}$
		Disable	—	—	0.1	

## 19.9 LCD voltage characteristics

**Table 83. LCD Voltage Characteristics**

Parameter	Symbol	Conditions	Min	Typ	Max	Units
LCD voltage	VLC0	LCD contrast disabled, 1/4 bias	Typx0.95	VDD	Typx1.05	V
		LCD contrast enabled, 1/4 bias, No Panel load	Typx0.94	VDD x16/31	Typx1.06	V
		VLCD[3:0]=0x00		VDD x16/30		
		VLCD[3:0]=0x01		VDD x16/29		
		VLCD[3:0]=0x02		VDD x16/28		
		VLCD[3:0]=0x03		VDD x16/27		
		VLCD[3:0]=0x04		VDD x16/26		
		VLCD[3:0]=0x05		VDD x16/25		
		VLCD[3:0]=0x06		VDD x16/24		
		VLCD[3:0]=0x07		VDD x16/23		
		VLCD[3:0]=0x08		VDD x16/22		
		VLCD[3:0]=0x09		VDD x16/21		
		VLCD[3:0]=0x0A		VDD x16/20		
		VLCD[3:0]=0x0B		VDD x16/19		
		VLCD[3:0]=0x0C		VDD x16/18		
		VLCD[3:0]=0x0D		VDD x16/17		
		VLCD[3:0]=0x0E		VDD x16/16		
		VLCD[3:0]=0x0F				
LCD mid bias voltage <sup>(NOTE)</sup>	VLC1	VDD = 2.7V to 5.5V, LCD clock = 0Hz, 1/4 bias, No panel load	Typ-0.2	3/4xVLC0	Typ+0.2	V
	VLC2		Typ-0.2	2/4xVLC0	Typ+0.2	
	VLC3		Typ-0.2	1/4xVLC0	Typ+0.2	
LCD driver output impedance	R <sub>LO</sub>	VLCD=3V	–	5	10	kΩ
LCD bias dividing resistor	RLCD1	1/4 bias, TA=25°C	7.0	10	13.0	kΩ
	RLCD2		35	50	65	
	RLCD3		56	80	104	
	RLCD4		168	240	312	

**NOTE:** It is the middle output voltage when the VDD and the VLC0 node are connected.

## 19.10 DC electrical characteristics

Table 84. DC Electrical Characteristics

Parameter	Symbol	Conditions	Min	Typ	Max	Units
Input High Voltage	$V_{IH}$	All input pins, nRESET	0.8VDD	—	VDD	V
Input Low Voltage	$V_{IL}$	All input pins, nRESET	—	—	0.2VDD	V
Input hysteresis	$\Delta V$	All input pins, nRESET, VDD=3V	100	200	—	mV
Output High Voltage	$V_{OH1}$	VDD=4.5V, $I_{OH1} = -2\text{mA}$ , All output pins except $V_{OH2}$	VDD-1.0	—	—	V
	$V_{OH2}$	VDD=4.5V, $T_A=25^\circ\text{C}$ , $I_{OH2} = -15\text{mA}$ , PE0-PE7	VDD-2.0	—	—	
Output Low Voltage	$V_{OL1}$	VDD=4.5V, $I_{OL1} = 10\text{mA}$ , All output pins except $V_{OL2}$	—	—	1.0	V
	$V_{OL2}$	VDD=4.5V, $I_{OL2} = 120\text{mA}$ , PD0-PD7	—	1.5	3.0	
Input high leakage current	$I_{IH}$	All Input ports	—	—	1	$\mu\text{A}$
Input low leakage current	$I_{IL}$	All Input ports	—1	—	—	$\mu\text{A}$
Pull-up resistor	$R_{PU}$	$V_i=0\text{V}$ , $T_A=25^\circ\text{C}$ , All Input ports	VDD=5V	25	50	100
			VDD=3V	50	100	200
		$V_i=0\text{V}$ , $T_A=25^\circ\text{C}$ , RESETB	VDD=5V	150	250	400
			VDD=3V	300	500	700
Pull-down resistor	$R_{PD}$	$V_i=VDD$ , $T_A=25^\circ\text{C}$ , All Input ports	VDD=5V	13	25	50
			VDD=3V	25	50	100
OSC feedback resistor	$R_{X1}$	XIN=VDD, XOUT=VSS, $T_A=25^\circ\text{C}$ , VDD=5V	600	1,200	2,000	k $\Omega$
	$R_{X2}$	SXIN=VDD, SXOUT=VSS, $T_A=25^\circ\text{C}$ , VDD=5V	2.5	5	10	M $\Omega$

## 19.11 Supply current characteristics

**Table 85. Supply Current Characteristics**

Parameter	Symbol	Conditions	Typ	Max	Units	
Supply current	IDD1 (run)	f <sub>HIRC</sub> = 40MHz	6.5	13.0	mA	
		f <sub>HIRC</sub> = 20MHz	4.0	8.0		
		f <sub>XIN</sub> = 16MHz	VDD=5V±10%	5.0	10.0	
			VDD=3V±10%	3.5		
	I <sub>DD2</sub> (sleep)	f <sub>HIRC</sub> = 40MHz	4.0	8.0	mA	
		f <sub>HIRC</sub> = 20MHz	2.5	5.0		
		f <sub>XIN</sub> = 16MHz	VDD=5V±10%	3.2	6.4	
			VDD=3V±10%	2.0		
	I <sub>DD3</sub>	f <sub>SUB</sub> = 32.768kHz or f <sub>WDTRC</sub> = 40kHz,	Sub run	90	180	uA
	I <sub>DD4</sub>	VDD=3V±10%, TA=25°C	Sub sleep	7.5	15.0	
	I <sub>DD5</sub>	Deep sleep, VDD=5V±10%, TA=25°C		0.5	3.0	

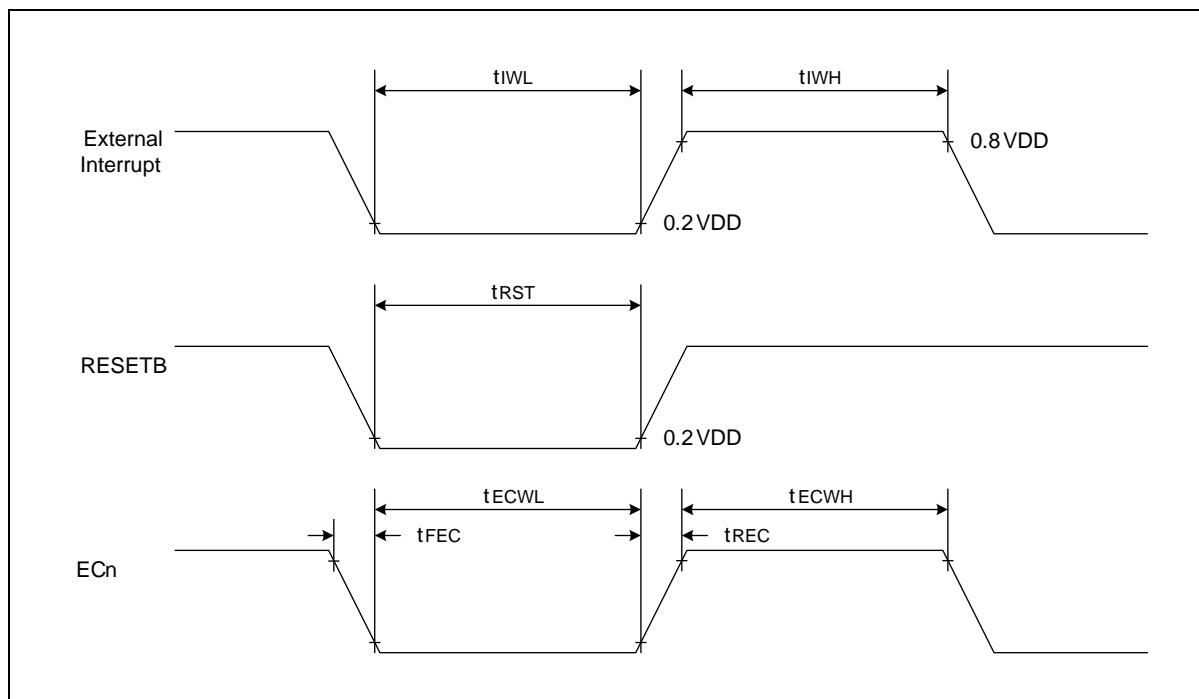

**NOTES:**

1. f<sub>XIN</sub> is an external main oscillator, f<sub>SUB</sub> is an external sub oscillator, f<sub>HIRC</sub> is a high frequency internal RC oscillator, and f<sub>x</sub> is the selected system clock.
2. All supply current items don't include the current of an internal watch-dog timer RC (WDTRC) oscillator and peripheral blocks.
3. All supply current items include the current of the power-on reset (POR) block.

## 19.12 AC characteristics

**Table 86. AC Characteristics**

Parameter	Symbol	Conditions	Min	Typ	Max	Units
RESETB input low width	$t_{RST}$	$VDD = 5\text{ V}$	10	—	—	$\mu\text{s}$
Interrupt input high, low width	$t_{IWL}, t_{IWH}$	All interrupts, $VDD = 5\text{ V}$	100	—	—	ns
External counter input high, low pulse width	$t_{ECWH}, t_{ECWL}$	$VDD = 5\text{ V}$ All external counter input	100	—	—	
External counter transition time	$t_{REC}, t_{FEC}$	$ECn, VDD = 5\text{ V}$ All external counter input	—	—	20	

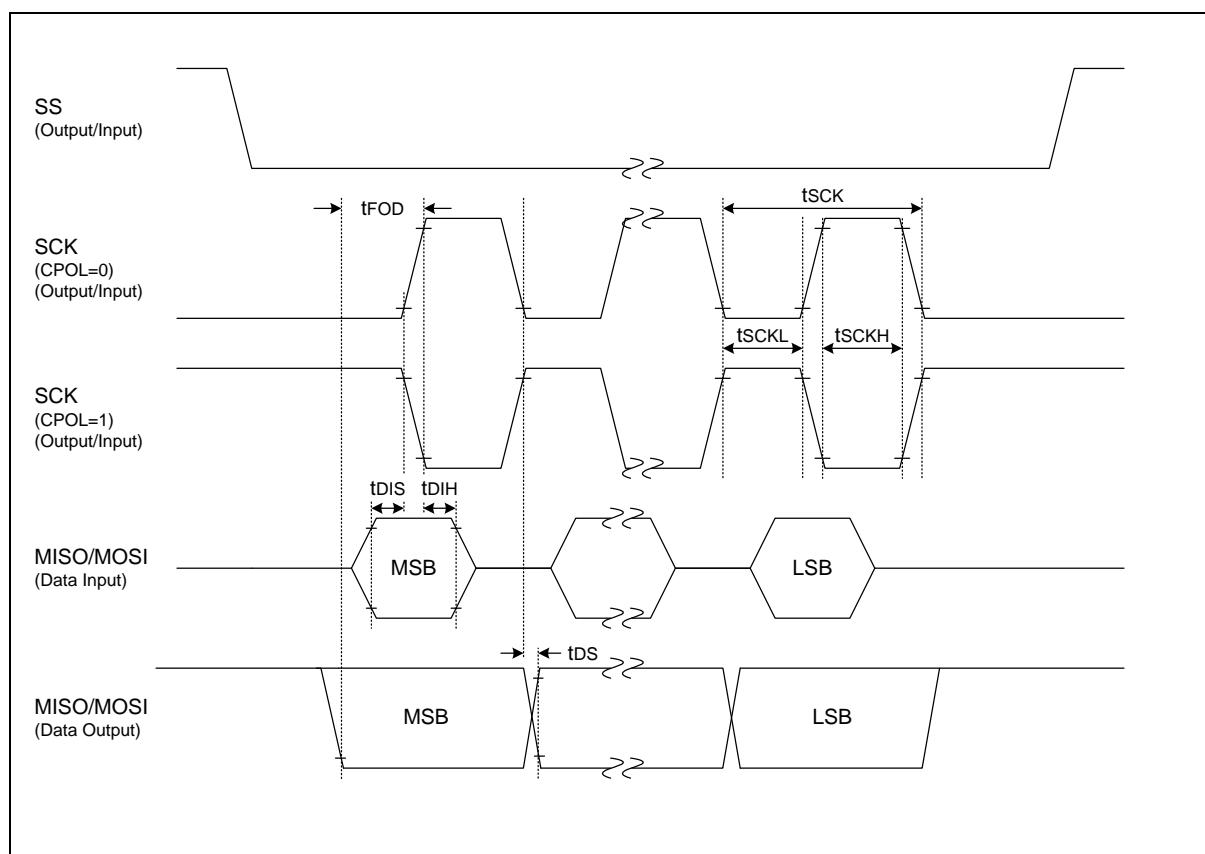

**Figure 105. AC Timing**

### 19.13 SPI characteristics

**Table 87. SPI Characteristics**

(VDD = 2.7V to 5.5V)

Parameter	Symbol	Conditions	Min	Typ	Max	Units
Output Clock Pulse Period	t <sub>SCK</sub>	Internal SCK source	400	—	—	ns
Input Clock Pulse Period		External SCK source	400	—	—	
Output clock high, low pulse width	t <sub>SCKH</sub> , t <sub>SCKL</sub>	Internal SCK source	180	—	—	
Input clock high, low pulse width		External SCK source	180	—	—	
First output clock delay time	t <sub>FOD</sub>	Internal/External SCK source	200	—	—	
Output clock delay time	t <sub>DS</sub>	—	—	—	100	
Input setup time	t <sub>DIS</sub>	—	180	—	—	
Input hold time	t <sub>DIH</sub>	—	180	—	—	

**Figure 106. SPI Timing**

## 19.14 I2C characteristics

Table 88. I2C Characteristics

Parameter	Symbol	Standard		Fast		Fast Plus		Units
		Min	Max	Min	Max	Min	Max	
I2C operating voltage	–	VDD $\geq$ 1.8V		VDD $\geq$ 2.0V		VDD $\geq$ 2.7V		–
Clock frequency	t <sub>SCL</sub>	0	100	0	400	0	1000	kHz
Clock high pulse width	t <sub>SCLH</sub>	4.0	–	0.6	–	0.26	–	$\mu$ s
Clock low pulse width	t <sub>SCLL</sub>	4.7	–	1.3	–	0.5	–	
Bus free time	t <sub>BF</sub>	4.7	–	1.3	–	0.5	–	
Start condition setup time	t <sub>STSU</sub>	4.7	–	0.6	–	0.26	–	
Start condition hold time	t <sub>STHD</sub>	4.0	–	0.6	–	0.26	–	
Stop condition setup time	t <sub>SPSU</sub>	4.0	–	0.6	–	0.26	–	
Stop condition hold time	t <sub>SPHD</sub>	4.0	–	0.6	–	0.26	–	
Output Valid from Clock	t <sub>VD</sub>	0	–	0	–	0	–	
Data input hold time	t <sub>DIH</sub>	0	–	0	1.0	0	0.45	
Data input setup time	t <sub>DIS</sub>	250	–	100	–	50	–	ns

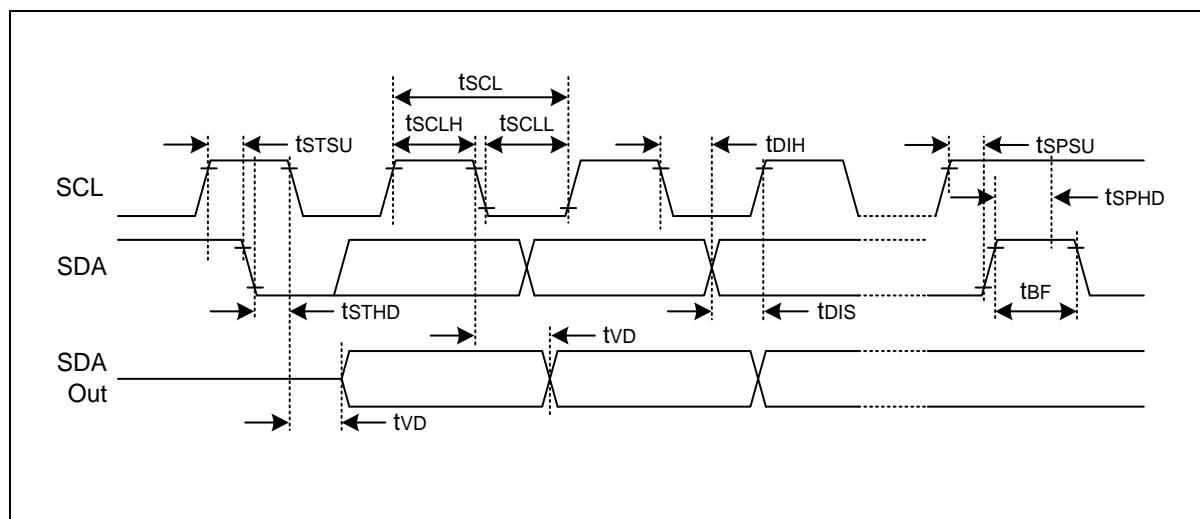

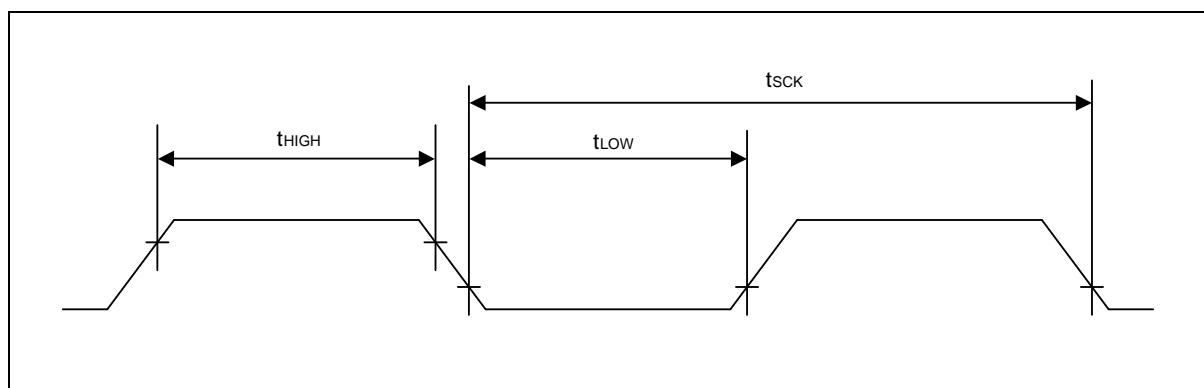

Figure 107. I2C Timing

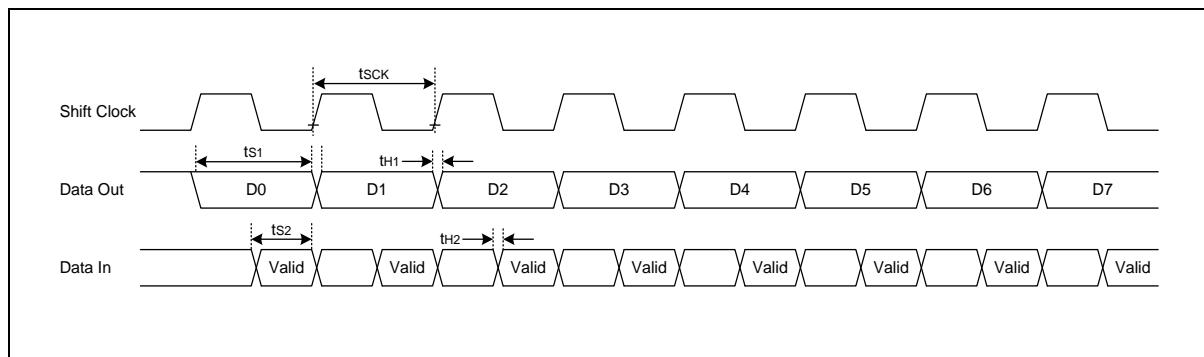

## 19.15 UART timing characteristics

**Table 89. UART Timing Characteristics (PCLK=11.1MHz)**

Parameter	Symbol	Min	Typ	Max	Units
Serial port clock cycle time	$t_{SCK}$	1,250	$t_{CPU} \times 16$	1,650	ns
Output data setup to clock rising edge	$t_{S1}$	590	$t_{CPU} \times 13$	—	
Clock rising edge to input data valid	$t_{S2}$	—	—	590	
Output data hold after clock rising edge	$t_{H1}$	$t_{CPU} - 50$	$t_{CPU}$	—	
Input data hold after clock rising edge	$t_{H2}$	0	—	—	
Serial port clock High, Low level width	$t_{HIGH}, t_{LOW}$	470	$t_{CPU} \times 8$	970	

**Figure 108. UART Timing Characteristics**

**Figure 109. Timing Waveform of UART Module**

## 19.16 Data retention voltage in Stop mode

**Table 90. Data Retention Voltage in Stop Mode**

Parameter	Symbol	Conditions	Min	Typ	Max	Units
Data retention supply voltage	$V_{DDDR}$	–	1.8	–	5.5	V
Data retention supply current	$I_{DDDR}$	<ul style="list-style-type: none"> <li>• <math>V_{DDDR} = 1.8V</math> (<math>T_A=25^\circ C</math>)</li> <li>• Deep sleep mode</li> </ul>	–	–	1	$\mu A$

## 19.17 Internal flash characteristics

**Table 91. Internal Flash Characteristics**

Parameter	Symbol	Conditions	Min	Typ	Max	Units
Page write time	$t_{FSW}$	–	–	3.0	3.5	ms
Page erase time	$t_{FSE}$	–	–	3.0	3.5	
Chip erase time	$t_{FCE}$	–	–	3.0	3.5	
Flash program voltage	$V_{PGM}$	On erase/write	2.0	–	5.5	V
System clock frequency	$f_{HCLK}$	–	2.0	–	–	MHz
Endurance of Write/Erase	$NF_{WE}$	<ul style="list-style-type: none"> <li>• Page 0 to 511</li> <li>• Configure Option Page 1</li> </ul>	$T_A=25\text{ }^\circ\text{C}$ , Page unit	10,000	–	Cycles
		Configure Option Page 2/3		100,000	–	
Retention time	$t_{RT}$		10	–	–	Years

### 19.18 Input/output capacitance

Table 92. Input/Output Capacitance

(VDD = 0V)

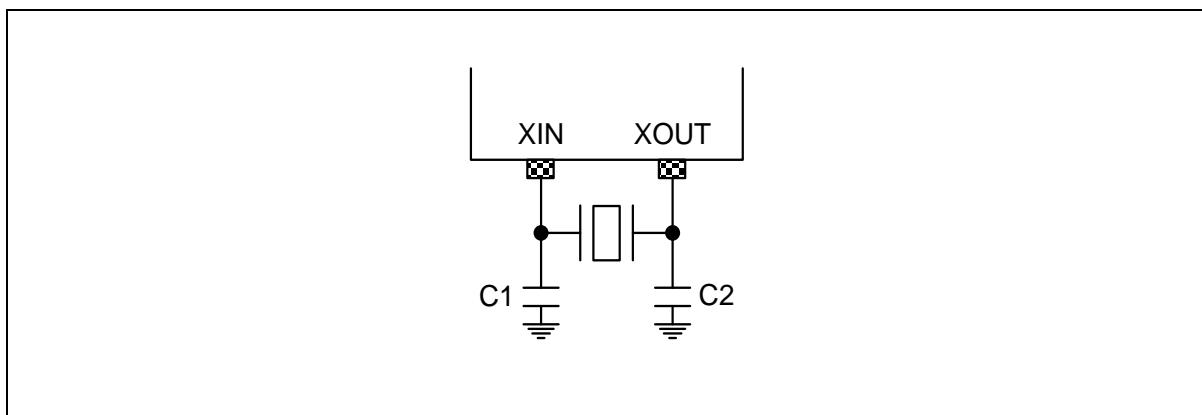

Parameter	Symbol	Conditions	Min	Typ	Max	Units
Input capacitance	C <sub>IN</sub>	• f=1MHz	–	–	10	pF
Output capacitance	C <sub>OUT</sub>	• Unmeasured pins are connected VSS				
I/O capacitance	C <sub>IO</sub>					

### 19.19 Main oscillator characteristics

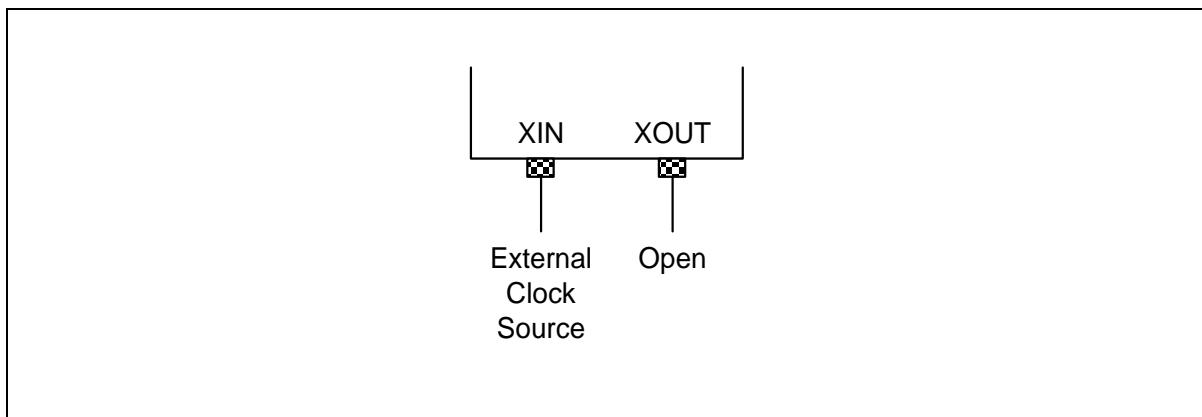

**Table 93. Main Oscillator Characteristics**

(VDD = 2.2V to 5.5V)

Oscillator	Parameter	Conditions	Min	Typ	Max	Units
Crystal	Main oscillation frequency	2.7 V to 5.5 V	2.0	–	16.0	MHz
Ceramic Oscillator	Main oscillation frequency	2.2 V to 5.5 V	2.0	–	4.2	MHz
		2.7 V to 5.5 V	2.0	–	16.0	
External Clock	XIN input frequency	3.0 V to 5.5 V	2.0	–	40.0	MHz
	External Clock Duty Ratio	–	–	50	–	%

**Figure 110. Crystal/Ceramic Oscillator**

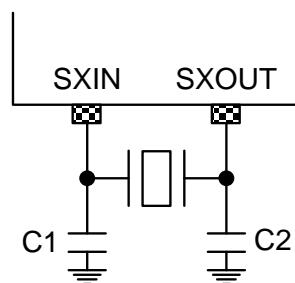

**Figure 111. External Clock**

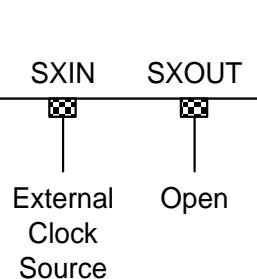

## 19.20 Sub-oscillator characteristics

**Table 94. Sub-oscillator Characteristics**

Oscillator	Parameter	Conditions	Min	Typ	Max	Units
Crystal	Sub oscillation frequency	–	32	32.768	38	kHz
External Clock	SXIN input frequency		32	–	38	

**Figure 112. Crystal Oscillator**

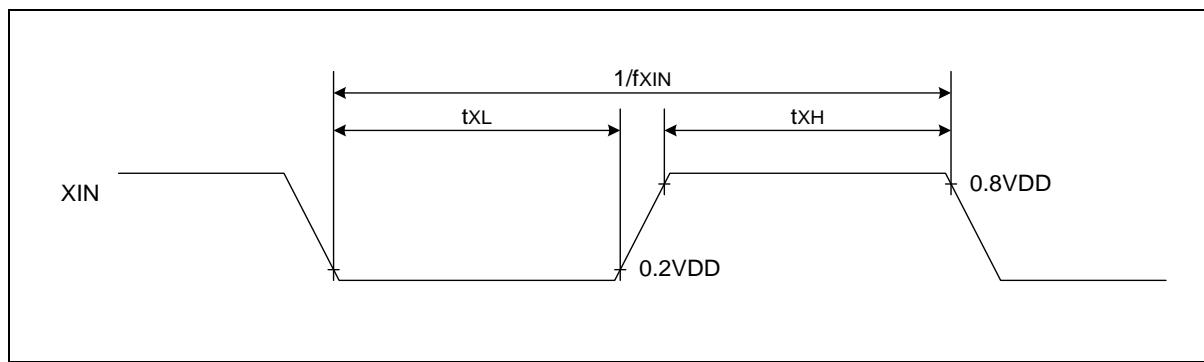

**Figure 113. External Clock**

## 19.21 Main oscillation stabilization time

**Table 95. Main Oscillation Stabilization Time**

Oscillator	Conditions	Min	Typ	Max	Unit
Crystal	<ul style="list-style-type: none"> <li><math>f_{XIN} \geq 2\text{MHz}</math></li> <li>Oscillation stabilization occurs when VDD is equal to the minimum oscillator voltage range.</li> </ul>	VDD = 2.7V to 5.5V	–	60	ms
Ceramic		VDD = 2.2V to 5.5V	–	10	
External clock	<ul style="list-style-type: none"> <li><math>f_{XIN} = 2.0</math> to <math>40\text{MHz}</math></li> <li>XIN input high and low width (<math>t_{XL}</math>, <math>t_{XH}</math>)</li> </ul>	12.5	–	250	ns

**Figure 114. Clock Timing Measurement at XIN**

## 19.22 Sub-oscillation stabilization time

Table 96. Sub-oscillation Stabilization Time

Oscillator	Conditions	Min	Typ.	Max	Units
Crystal	–	–	–	10	sec
	VDD=3V, TA=25 °C	–	0.7	1.5	
External clock	SXIN input high and low width (txL, txH)	5	–	15	μs

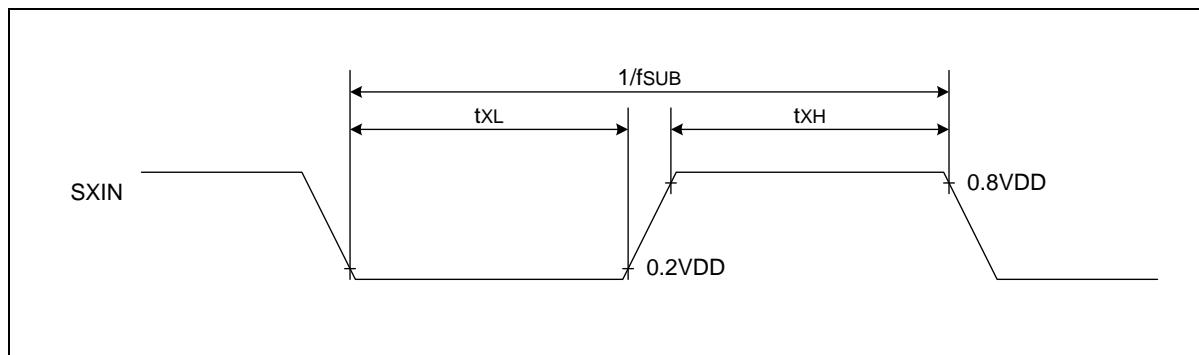

Figure 115. Clock Timing Measurement at SXIN

## 22 Development tools

This chapter introduces wide range of development tools for A31G12x series. ABOV offers software tools, debuggers, and programmers to help a user in generating right results to match target applications. ABOV supports entire development ecosystem of the customers.

### 22.1 Compiler

ABOV semiconductor does not provide any compiler for A31G12x series. However, since A31G12x series have ARM's high-speed 32-bit Cortex-M0+ Cores for their CPU, you can use all kinds of third party's standard compiler such as Keil C Compiler. These compilers' output debug information can be integrated with our A-Link and A-Link Pro. Please visit our website [www.abovsemi.com](http://www.abovsemi.com) for more information regarding the A-Link and A-Link Pro.

## 22.2 Debugger

The A-Link and A-Link Pro support ABOV Semiconductor's A31G12x series MCU emulation in SWD Interface. The A-Link and A-Link Pro use two wires interfacing between PC and MCU, which is attached to user's system. The A-Link and A-Link Pro can read or change the value of MCU's internal memory and I/O peripherals. In addition, the A-Link and A-Link Pro control MCU's internal debugging logic. This means A-Link and A-Link Pro control emulation, step run, monitoring and many more functions regarding debugging.

The A-Link and A-Link Pro run underneath MS operating system such as MS-Windows NT/ 2000/ XP/ Vista/ 7/ 8/ 8.1/ 10 (32-bit, 64-bit).

Programming information using the A-Link and A-Link Pro are provided in Figure 127. More detailed information about the A-Link and A-Link Pro, please visit our website [www.abovsemi.com](http://www.abovsemi.com) and download the debugger S/W and documents.

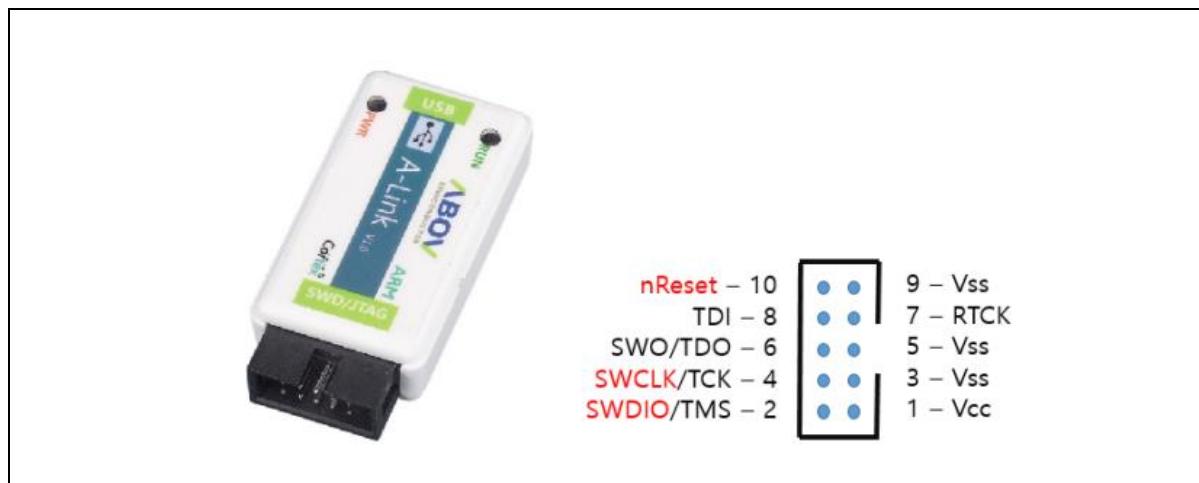

Figure 127. A-Link and Pin Descriptions

## 22.3 Programmer

### E-PGM+

E-PGM+ is a single programmer, and allows a user to program on the device directly.

- Support ABOV devices
- 2~5 times faster than S-PGM+
- Main controller: 32-bit MCU @ 72MHz
- Buffer memory: 1MB

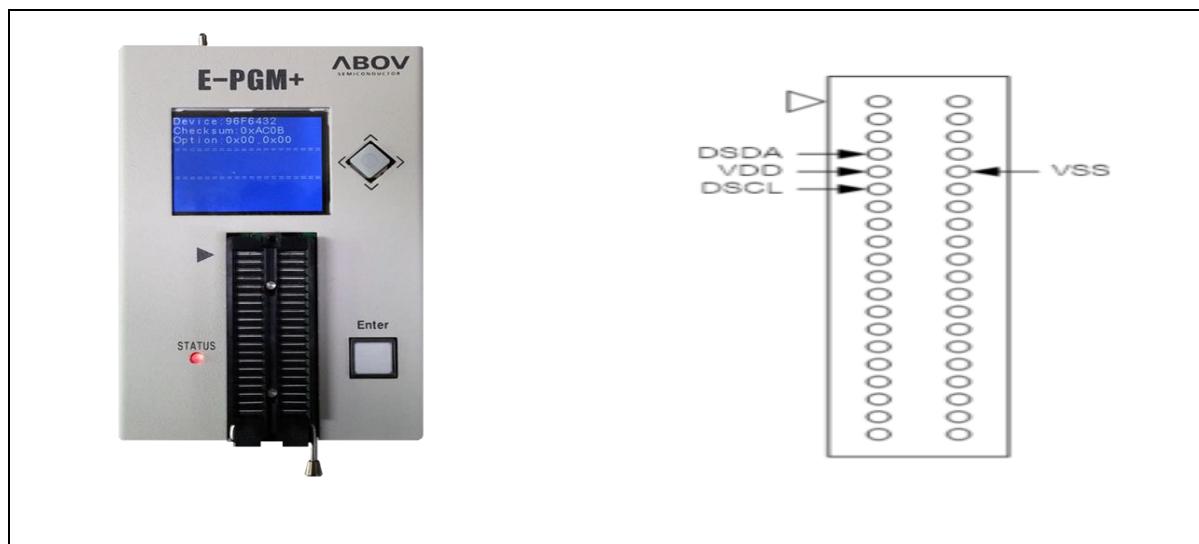

Figure 128. E-PGM+ (Single Writer) and Pin Descriptions

### Gang programmer

E-Gang4 and E-Gang6 allows a user to program on multiple devices at a time. They run not only in PC controlled mode but also in standalone mode without PC control. USB interface is available and it is easy to connect to the handler.

Figure 129. E-Gang4 and E-Gang6 (for Mass Production)

## 22.4 SWD debug mode and E-PGM+ connection

Connections for SWD debugger interface or E-PGM+ is described in figure 130.

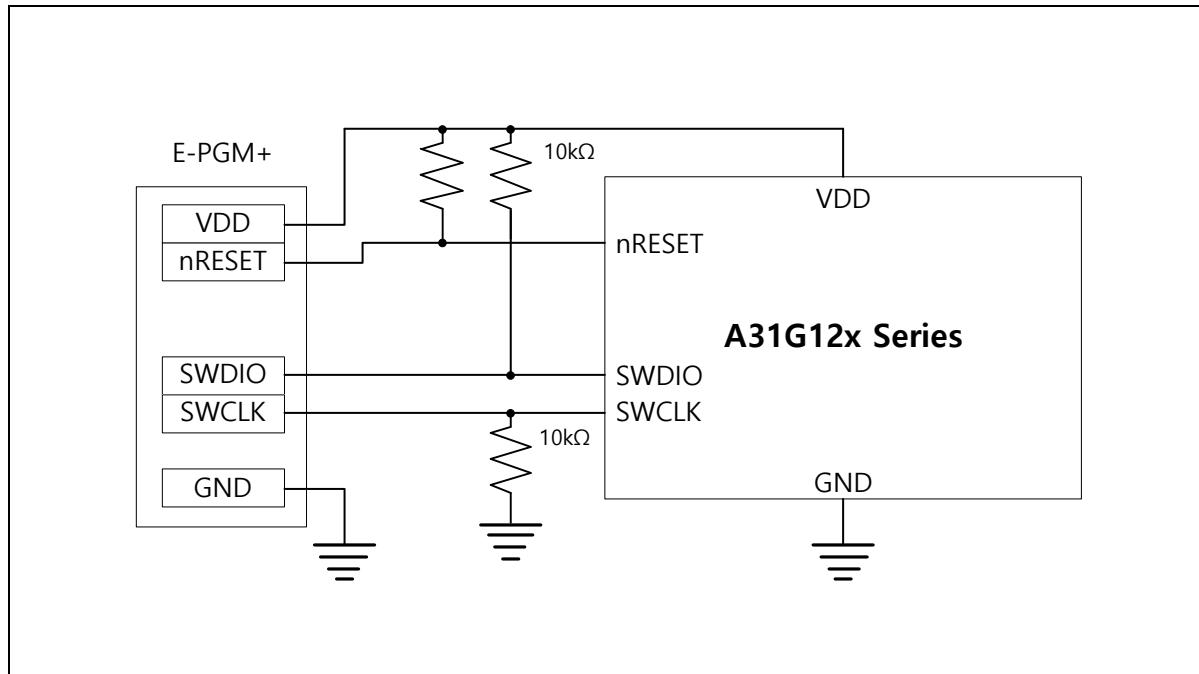

Figure 130. Connection between A31G12x series and E-PGM+ using SWD Debugger Interface

## Revision history

Date	Version	Description
Sep.4, 2017	1.0.0	1 <sup>st</sup> creation
Jan.18, 2018	1.0.1	Add Package Naming Rule
Aug.30, 2018	1.2.0	Change Flash Endurance Times Remove LVR 1.68V/1.77V/1.88V, LVI 1.88V Modify Notes of Clock Monitoring Circuit Diagram in SYSTEM CONTROL UNIT. Modify Notes of Figure 10.1 Block diagram in TIMER COUNTER 30. Update All Package Dimension Remove Special Test in Device Nomenclature Update Operating Temperature Typos modify
Dec.16, 2019	1.2.1	Add a package type, "A31G123RN (64LQFP-1414)". Add notes, "Section 1, Chapter 1. OVERVIEW, Figure 1.3 ~ Figure 1.5". Add a table, "Section 2, Table 1.2 Functional table on current mode". Add notes, "Section 2, Chapter 12. USART 10/11/12/13, Figure 12.2 SPIn Block diagram". Change value, "Section 3, Chapter 2.1.4 Power-On Reset Characteristics". Add a item, "Section 3, Chapter 2.1.17 Internal Flash ROM Characteristics". Modify note, "Section 2, Chapter 16.2.1 CRC Control Register". Typos modify.
Jan.16, 2020	1.2.2	Modify a figure, "Section 1, Chapter 3. BOOT MODE, Figure 3.3". Typos modify
Apr.9, 2020	1.30	Applied a new format to this document.
Nov.30, 2020	1.31	Add a note about disabling "clock monitoring function", "Chapter 5.6.19 SCU_CMONCR", clock monitoring control register. Add notes about TXEn bit and RXEn bit, "Chapter 14.3.1 USARTn_CR1" USARTn control register 1.
Oct.27, 2022	1.40	Change the document format.
